Yahoo Group summary: Drake Radios

These Yahoo Groups messages were archived in WARC format by ArchiveTeam in 2018. This PDF was generated by Digital Library of Amateur Radio & Communications from the WARC files in 2026.

Date span: 2006-06-02 through 2011-12-31

Source WARC: drakeradio.EYFOPdl.warc.gz

Source item: https://archive.org/details/yahoo-groups-2018-06-01T00-05-23Z-e1e146

Messages included in this PDF: 6221

Message records with no body available in the source archive: 2

Messages omitted as spam from this PDF: 16

Yahoo replaced the domain portions of email addresses with @... in the archived messages. Characters lost in Yahoo's archived text appear as ?.

Messages are presented in ascending Yahoo message-ID order. Gaps indicate records absent from the source WARC or messages omitted from this PDF as spam.

1. Hello!!

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-06-02 00:24:08 UTC
From: donfrasher
Topic: 1 Message: 1

Give a little while to figure out all the options for the list!! I
hope to ba able to add back-up moderators in the future just in case
anything should happen to me.
and Thanks for joining!! I hope this will work out better for all
of us.

73 Don KE7FFM

Please invite other Drake users that you may know to join as well

2. FS: Drake B & C-Line Parts Locator CDs

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-06-02 02:45:51 UTC
From: Garey Barrell
Topic: 2 Message: 2

These CDs are _NOT_ just scans of the original "Operation and Service" manuals provided by Drake! (Although High resolution scans of the original manuals ARE included on the CDs!)

What these CDs _DO_ include is information not available anywhere else.

Full color, high resolution photos of the chassis and each PC board, (excluding PTO,) with each part identified and keyed to a tabulated Parts List. These photos will print on 8.5 x 11 paper, but may also be enlarged more than five times on screen for a closer look.

Also included is never before published schematic and other information about the Passband Tuner in the R-4B..

Schematics for all known versions of each receiver and transmitter that may be printed in original full 11 x 17 size, either on your own printer or at a Kinko's or other office support location.

Over 100 pages of miscellaneous additional files, errata sheets and alignment data.

All documents in PDF form and readable on most platforms, (including MAC and LINUX,) with appropriate FREE reader available from Adobe Systems.

Sample pages and full ordering information may be seen at <www.k4oah.com>

Each CD (Specify B Line or C Line) is available for $25 postpaid to US and Canadian addresses only. Additional postage charges for non US/Canada delivery. Inquire.

Coming Soon! Drake 2-B / 2-BQ receiver CD.

Email to <Drake4@...> for more information.

3. Thanks

I want to take a minute to thank those that suggested the new Drake group. I too, was very tired of the SPAM coming in on a daily basis. Over time I'v learned a lot from other members to keep my Drake gear on the air.I do belive this was long over due, and very happy to see the new group started. I hope all will follow.

It was long overdue. Glad to have you aboard. I also would hope
that this group will stay active. On the old group, even with the spam and
no moderator, the lack of flame wars and all the helpfullness is a comment
on the members. not only are Hams a great bunch people, but it seems even
more so to me with the users and collectors of boat anchors and Drakes.
great radios, and even better people.
now that your here, stay awhile and lets see how it all turns out.

15. FW: Station for sale

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-06-04 19:26:33 UTC
From: Don
Topic: 15 Message: 15

would like to offer the following station to the Drake Group.

1. Drake TR-7 Transceiver - Serial #9815 in excellent condition and appearance with basic filters. One original manual in near new condition and one copy of same manual.

2. Drake PS-7 power supply - Serial #8977 in excellent condition and appearance.

3. Drake RV-7 remote VFO - Serial #1175 in excellent condition with several light scratches on top. A copy of the manual is included.

4. Drake MS-7 Speaker - Serial #6170 in excellent condition and appearance.

5. Drake #7077 microphone in excellent condition and appearance along with a second microphone (7077) for parts.

All equipment has extended front feet except the power supply.

I have been using this station on the air for two years now with no problems and good signal and audio reports.

I would like $1,150.00 plus shipping for this station. Any interest please contact me via e-mail off the list.

Thank you to the list.

Hopefully some others on here will be more familiar with this line. were
up to 30 members now and still growing. I started the new group not because
I am a drake genuis (im not), but dealing with the spam got really old.
is there a parisitic choke for ten?? resistor with a coil wrapped
around it? does it look burnt? I would think that could cause it to not
tune correctly and low output on one band like that, but that is just a pure
shot in the dark coming from me.

Don,

Most of the final tubes used in the old rigs did not have full power at the higher frequencies. As they "weaken" the power at 10 meters is the first to go. I suspect that your finals are just getting weaker.

Daniel,

The hint might be that you got more RF output when using the RV-4.
That suggests that the output of the crystal oscillator and PTO might
be weak on 10M, which reduces the total drive to the 12BY7.

You mention you did the alignment procedure. Perhaps you should go
back and make sure the unit was not tuned / adjusted for 11M? That
might help. Do you have the owners manual, or a copy?

Hi Steve

Problem is solved. All OK. I've done a modification (digital display connection) BEORE:

http://aade.com/Cdrake/CDrake.htm

So, if a disconnect the wire from PIN 8 of the V3 tube, all is working properly. I have put the
47pF to far away ot PIN 8 instead DIRECTLC on PIN 8. And perhaps a have to reduce the capacity a little bit.

Thanks for all your infos.

Daniel, HB9DDS

26. Frequency read?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-06-09 20:21:41 UTC
From: Daniel
Topic: 26 Message: 26

Hi folks

What do you think about the following:

I made a frequency readout comparison. When I go on my TS-2000 to 14.225 (USB) and then to the same on my Drake TR-4, both redout (analog + digital) are approx. the same. Then I'm changing to a signal on 3.754.45 LSB (TS-2000). The same signal is on my Drake TR-4 at 3.755.20 LSB.

Is it really true, that I should calibrate every time when I'm changing bands? Or is that a missunderstanding on my side? How can I manage that a little bit more comfortable?

Daniel, HB9DDS

27. Re: Frequency read?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-06-10 14:22:14 UTC
From: w1kilofoxtrot
Topic: 26 Message: 27

Daniel

Because most of the bands on the TR family rely upon heterodyne crystal oscillators to adust the LO frequency, each band must be calibrated if your are measuring the PTO frequency. If you're sniffing the output of the cathode follower, you are reading the actual frequency of interest, +/- any error in the 9 MHz IF frequency. I see you have eliminated this by looking at 20M and 80M. Now, any discrepancy can be accounted for by the difference in the adjustment of the carrier oscillator. You're looking at 750 Hz difference. On 80M, it's Fin + Fpto = Fif (9 MHz). On 20M, it's Fin - Fpto = Fif. If my math serves, you might have the carrier off by 375 Hz, or the crystal filters are off by that same amount.

I don't know the details of the Kenwood, but it might have a small error as well?

For what it's worth, I could (and do, I have 2 TR-3s) live with that size (375 Hz) error.

Hope this helps.

Topic: 29 Message: 29

Dishonorable TR-3 No.1 has a relay that I can't keep clean. That means bad receive, intermittent transmit, the works. I've tried paper soaked in solvent, 800 grit auto body 'sand'paper, and sacrifcing a chicken to Papa Legba.

Any suggestions on a replacement unit, possibly one with a cover???

73,
Steve

http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/RelayCare.htm

This is the best I have came up with with, it gives some methods of cleaning the contacts that maybe you haven't tried yet.
Also, while I do not have a tr-3 here to check, I have a small parts house nearby that has a huge selection of relays instock. if you have any supplier aroundyou might try taking the relay with you to compare not only the specs, but for physical size. often, if they do not have one in stock that matches, they may be able to measure it and do a cross refrence for you. I know that is probably what you had hope to avoid, but it has got me switch replacements on other equipment that worked and fit well.
And please repost the question again in a few days, as we gain more members to the group we might have some one come on board who has allready gone through this process.
I can't believe the chicken didn't work!! might have to try a young goat next time!!

Steve -

Drake offered a small mod kit to replace the wired-in relay of the TR-3 and early TR-4, and for the T-4X. It consists of a little PC board with a socket for the "standard" plug-in relay used in "all" other Drake transmitters.

The relay is the P&B (TYCO) R10-E1-Y4-V2.5K available from Mouser and others for about $15.

John Kriner has the PC board and several pages of installation instructions for sale in his EBay store at

<http://tinyurl.com/q8k26>

You can do it "by hand", but the PC board and instructions save a lot of grief!

Thanks , and thanks for the support!! we're up to 38 members now! As
the the group is still on the small side please allow 2 or 3 days for an
answer as many of us are not able to get to our e-mail as often as we would
like.
If after a few days you still haven't got the help you need, please re-post
your questions and I will try to find out what I can. I am not a guru!!
and my only drake experience is with the tr-7. however, If no one else
seems to be able to help, I'll try to check my local experts and such to see
what I can come up with..
Thanks to all for joining !! while I am not the radio genuis, I
will try to keep the list promoted and as spam free as possible.

Good morning to the "New Drake" list.

I just recently bought an L4-B and have seen posted somewhere a site that was selling the power supply board and all parts associated with same. Does anyone have the info on who is selling this kit? Yes, I'm aware the Heathkit Shop makes the board for the AC-4 and will probably replace all three of mine soon. I already have found the chimneys and anode connectors that were missing as well.FYI Ameritron sells the original chimneys that are the tapered type that force the air to move across the anode connector and at a very respectable cost. Better than using Coleman lamp glass. There is a wire wound resistor on a small circuit board between the 80 and 40 meter input coil that is toast. I need to know the value and wattage of this resistor, and possibly the suspect failure the would cause it to burn up if anyone has experienced this same problem.I hope to have this on the air soon, so that the whole station is Drake! Then to use the Henry amp as a door stop.

Thanks to the moderator for keeping all the SPAM out of here

I checkd youon qrz.com. I prettymuch grew up in southern Ohio in a small
town called Lucasville. my uncle Chester Kilgore lived in Portsmouth and is
the one who got me interested in Ham Radio. When he should me his shack and
all the homemade equipment, big glowing tubes the crackle of distant voices
coming over the speaker, I was hooked!
While from there I pursued electronics as a hobby, it was another ten
years after that before I became licensed.
very shortly after that me uncle became a silent key. I don't know his
call, but i do know he was very active until about 1979-80.
Your shack certainly reminds of that time when I first saw ham radio.
My own stock of gear is slowly growing, but I have grands with us right now,
and still have a couple of years left before the house is paid off. the
will be the big boost!!
Thanks to you all who have joined the list so far, if there's anything
can do to help things out here, please ask!

Mike,

there is a Drake traders net on 75 M on Wed & Sat evenings at 2000 local time. There was a ham who was selling a parts list form a L-4B. I do not have his call nor do I know if he still has parts. The frequency is 3.938 LSB. coming out of Virginia. I do not know if you can hear this net or not.

Thanks Don,

There is bound to be someone parting out one of these amps someplace at some time.

I know it took me a year to find a meter for an old Gonset GSB-100!

I do understand. No one wants to let go of such hard to find parts , at least , not collectors. And unfortunately, sometimes about the only source for many of these parts are from the E-bay butchers. I am really not against e-bay, just those who will destroy a good radio to sell the parts.
Feel free to post an occansional reminder that your looking for the plate meter, and if not me, maybe someone on the list can come up with a spare.

Well Don,
I just finished it off today, and brought it up from the shop, and it's on the air now. I just watch the grid current, and tune with the watt meter. The only thing I really like to keep an eye on is the idling current, that at present have no idea what it is. I'll check back from time to time and see what comes up. Some one was trying to sell the CW/SSB switch for $100.00 last week on the "E" place! Now it's re-listed and at last check was $26.?? and hasn't met his reserve. Go figure!

Mike -

I don't have a replacement meter, sorry. Just a thought. I don't know if it is a conventional spring-wound movement or a taut-band, but I have seen the spring-wound movements develop corrosion in the zero adjust mechanism and go "open" since the coil connection is through that assembly. "Exercising" the zero adjust will sometimes clear the corrosion. Otherwise, meter coils rarely open "inside", favoring solder connections at the winding ends.

Good luck!

59. Drake 2-B Service CD

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-06-28 20:02:10 UTC
From: Garey Barrell
Topic: 59 Message: 59

Drake 2-B Service Information

This is NOT just a scan of the Drake original manual!! (Although a CLEAR, Hi Res scan IS included!!)

Also included is information not available anywhere else.

1. Complete part list showing all resistors, capacitors and semiconductors keyed to full color, high resolution photos, showing their location on the PC board or chassis. A total of 5 pages in PDF.

2. Full color, high resolution photos of the chassis and each PC board with each part identified. Sized to print on 8.5? x 11? pages, or may be enlarged on screen for a closer look. A total of 18 photos in PDF.

3. Never before published schematic and other information about the Passband Tuner.

4. Data based on Version 531626290 or [05/31/62 s/n 6290 +]. Photos are of a 10000 series unit which agrees completely with the 6290 schematic. Full size (11" x 17") scans of schematics for the 2-A and earlier 2-B versions included.

6. High resolution scans of original manual for the 2-B with CLEAR chassis photos. A total of 38 pages in PDF.

7. Miscellaneous additional files, errata sheets, modifications and alignment pages. A total of 32 pages in PDF.

All documents in PDF and readable on most platforms, (including MAC and LINUX,) with appropriate FREE reader available from Adobe Systems.

Sample pages and full ordering information may be seen at <www.k4oah.com>

The CD is available for $18 postpaid to US and Canadian addresses only. Additional postage charges for non-US/Canada delivery. Inquire.

Email to <Drake4@...> for more information.

Yes, the B & C Line versions are still available as well.

I have two immaculate TR7s with matching PS7s.
I would like an R7 to work with one of the TR7s.
There maybe someone out there who would consider my TR7 for their R7,plus cash adjustment?
The downside of course,I am in South Africa!

61. Drake TR-22 charge cord FS

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-07-08 22:12:39 UTC
From: Ken Simpson, W8EK
Topic: 61 Message: 61

For Sale:

Charge cord for Drake TR-22
I found a plastic bag with a 110 V AC power cord in it, along with a note saying "TR-22 charge cord". It is a 2 conductor cord, with a standard plug on one end. The other end looks somewhat close to a TV "Cheater" cord. It is in very close to new condition. $10

Other Drake items for sale:

Drake TV-5240-LP low pass filter
This number is correct; it is not a TV-5200. This filter is different than the typical low pass filter. It has an SO-239 connector on each end, but instead of being long and skinny, the enclosure is about 5 inches square. I think this is a fairly old filter. It has brownish/gray paint over the copper colored case. I have not been able to find any specs on this filter. It does say "For use in 52 ohm line of transmitters operating below 30 Mc." printed on it. If anyone has any additional information on it, I would appreciate hearing. $30

Drake TV-300-HP high pass filter
High Pass filter for the TV for 300 ohm twin lead.
This filter is collectable, and is unused as best I can determine. It is still in its original box (not the newer blister pack), with an "RLD" logo on it, and says "NEW TV-300 HP High Pass Filter, Attenuates 0-52 MHz". A grounding strap is also attached. $ 15

Prices do not include shipping from Florida.

Thanks.

73,

Ken, W8EK

I have a stock SPR-4 in overall good condition for $275 has FS-4
sticker on the preselector so you can see what each position
corresponds to what MHz. pretty neat.
does not include the AC cord but I can attach an AC adapter to the DC
input that can easily be removed without any damage.

We have had a few new members lately and the list is now up to a total of 49 members.
And while I am moderating for spam, I dont have a problem with list being open to talk on any area of Drakes. Just using our Drakes, contacts we've made, do we use it for FD or other contest, or has anyone here tried using psk31 or any other digital?? Back in the late 80's I was running rtty on a TR7, but i certainly haven't tried any of the new modes.

Anyway, Welcome to all of the latest members, I hope you enjoy our group!!

Thats going to be a tough one !! maybe somebody on the list has an extra replacement or knows of a source.
I would also try contacting:

http://www.wa9tgt.com/index.html

It wouldn't hurt to ask them, I am sure that your not the first person to need one, and they seem to be willing to go the extra mile to keep these radios looking and working great.

As a last resort, keep an eye on e-bay.

73. Drake set for sale

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-08-06 13:37:04 UTC
From: Alan Parker
Topic: 73 Message: 73

Greetings all,

I have the following for sale:

Drake T4XC, serial #21503
Drake R4C, serial# 18210 w/500 cw filter
Power supply and cord
Speaker and cabinet
Manuals on CD Rom

Sale to continental U.S. only, located in Texas and will consider
meeting half way for a reasonalble distance.

Price: 400.00

Would rate a 5-6 on scale to 10. My dad bought the set from a SK
here and gave to me. Just don't have time to do anything with it.

Thanks for reading,

Alan

Alan - have you checked ebay? From casual looking at Drake stuff, I think you can get a lot more $ than that for a C line on ebay, IF you sell each piece separately. The receiver alone could go for close to that much.
Good Luck!

Thanks Wayne,
Well I've looked at ebay too and really didn't want to
mess with all that. But, if nothing moves soon I can
talk with a guy at work and see if he can list it. Do
you suggest selling each piece seperate? I would've
thought the whole set might bring better results.
But, yall are the experts, so I'm open to any
suggestions.

Alan

I wish I had the $ 400.00 .Have they been on the air lately. I just Love they way those Tubes Glow. I'm with Wayne. If they are clean and in good operating condition you could probabily do better on the price. I have a Drake TR-4 that
my Grandpa used to use. I still plug her in once in awhile. With the way the storms pop up I leave most everything unhooked and unplugged. Oh yea, I use the Kenwood TS-2000 mostly...You just gotta Love those Drakes. I always wanted a set of Drake Twins. Sorry to say I am so broke I don't have a pot to piss in. Seems the good deals always come around when you are penny less....LOL....Good Luck Alan. I am sure you will make someone very happy. There are alot of collectors out there. I'd be one but that takes money....Hey if you got any good pictures of the twins, radios on or off and you got the time send em my way, thanks...Bill In Ohio...73's...DE...KC8ILP...

I'm thinking of changing my name to " A day late, an a dollar short "...LOL

Mike,

I haven't seen any formal conversion notes on the CW filter. I looked into it a while ago and decided the easiest way would be to use the mini relays a la Bob Sherwood to switch the CW filter in place of the X position filter. The problems are to avoid filter "blowby" and provide a neat way to control the relays.

Duplicating the original Drake CW install looks like a lot of work and has the challenge of finding the rotary switch.

All suggestions are welcome.

88. TR-3 TR-4 Question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-08-16 21:51:49 UTC
From: John Silberman
Topic: 88 Message: 88

Hello everybody,

I'm John and I just now joined your group. I have a few Drakes, some even work! ;) I love my R4b. It works great.

My question to the group is, besides sidetone and semi brake-in CW in the TR-4, what are the other differences, if any, between the TR-3 and TR-4, not the C or CW versions. Which would be preferable to own (and operate), and is there anyone in Florida that can take a working one and make sure it's up to snuff? I'm not looking to make it a museum piece, just take a working radio and bring it close to specs to make it an every day radio. Thanks in advance.

John

I find the TR-3 challenges relate only to it's age, and the availability of replacement parts. I've got a pair of them. One has been a peach, and the other a PIA to keep running. But, it's simple to do. I joke that all you need is a flat blade screwdriver and a Weller iron and you can get them purring.

Manuals are availble on line, and the support in this and other on line groups is second to none.

Have at em!

Topic: 88 Message: 92

Hi John,

The TR-3 is the first and only all tube transceiver that Drake made. The first with the linear tuning PTO. The crystal filters are only 2 pole so the skirts aren't as steep as the later TR-4s. The finals are 12JB6s while the later rigs are 6JB6s. Both types are still available. TR-3 doesn't have the remote receiver slide switch on the left side to cause deafness at the wrong time.

Since I own a TR-3, TR-4 and TR-4CWrit I have the pleasure of playing with each. If I had to choose one to keep it would be the TR-3 as it works just fine for chatting on SSB and represents the end of the all tube era and the beginning of the dedicated SSB transceiver rigs. A wonderful piece of Drake engineering history.

While I am a bit further away than FL I do repair the Drake equipment and just finished up a nice TR-3.

From: dlgillen
Topic: 94 Message: 94

HI,
Are there any good sites on the web that talk about cleaning these radios?

I would like to give it a try for myself.

Or any suggestions from the list to get me started.
Thanks,
Dan
K9SLY

95. Re: [DrakeRadio] Cleaning the Drake?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-08-17 23:18:55 UTC
From: Don
Topic: 94 Message: 95

For myself, I have for several years used windex class cleaner and a toothbrush for chasis, outside, knobs, ect. and alcohol for most switches, pcb's and such as that.

http://www.logwell.com/tech/servtips/cleaning.html

While I have yet to try it myself, on the Tektronix oscilloscope groups list, it has been stated several times that the best way was simple green and water and hose them down generously, left to dry out. they recommend this procedure for both tube and solidstate units, and I understood that Tek had some service manuals that included instructions for "wetwashing" scopes in the field. Below is part of a post from the Tek groups giving some detail of the steps used.

The first thing to consider is if it really needs to be washed, or if
you can clean it satisfactorily with cleaners and a water spray
bottle. You can carefully remove the tubes one section at a time. Be
careful cleaning the tubes, even a dry rag will sometimes remove
their markings.

Also, it is good to operate it before you wash it if possible. That
way, you can tell if you have added any new problems in the course of
the cleaning.

If you really want to give it a bath, here is how I do it:

I start by removing the plugin (do it seperately), side and bottom
covers, bezel, graticle and crt, the HV covers, the fuse, and the air
filter as well. I leave the knobs in place to prevent water from
getting in the bushings of the pots and switches. I also leave the
tubes in their sockets to help keep water out of the sockets. If you
have compressed air, or can take it to someone who has, now is the
time for a good dusting-out.

I cover the HV transformer and the open bottom of the LV transformer
with the famed sandwich bags. Remove any black cardboard covers over
filter capacitors, and cover any that won't come off with sandwich
bags.

I then take the scope and put it on a towel in the bathtub, being
careful not to scratch the tub (again). I liberally spray the
degreaser (I use Mean Green from Walmart) over the entire instrument.
It is well to consider how dirty the underside of the instrument is,
and if you need to clean it or not. Most of these instruments got
dirty from the top, and the less water inside, the better.

I let the degreaser soak for 15 minutes or so, adding a bit more on
the really dirty sections. Then I spray it out with the shower spray.
I try to get the water hot but not scalding. I use a moderate

pressure. Try not to leave the spray too long on any one spot. Avoid the two transformers covered with the bags as much as you can.

As soon as I am done I remove the sandwich bags, draining any water in them carefully so as not to get it inside the instrument. I let it sit for a few minutes, and then blow it out with compressed air. Be careful not to get to much pressure.

The next phase is important. The 535 chassis is too big for most ovens, unless you live in a hotel. You can leave it out in the Australian summer sun, I am told. LOL. You can put the back end in the oven and put a cardboard box over the front that sticks out. Or you can build a simple oven using big boxes, styrofoam, etc. Stan's book covers this aspect very well.

The important part is not to let the temperature exceed 85C, as the filter capacitors will suffer if gotten hotter than that. I use about 125F, checked with my temp meter. as most oven controls are very inaccurate at this low setting. If you don't have a way of checking, I let the chassis get hot but not uncomfortable to touch. About 24 hours seems to be good, but if you didn't have compressed air, you might need 2 or 3 days. A small fan in the oven helps.

After it is dry, it is important to lubricate the pots and switches, as their lubricant is now history. I use ordinary contact cleaner, but many on here have better knowledge than I do. REPLACE THE COVERS OVER THE FILTER CAPACITORS, as these can kill you if you contact them directly. Replace the crt as per the instructions in your manual.

Once you turn it on, you may find an obvious problem with frequency response as shown by a square wave. This means there may be some moisture left in the trimmer capacitors. Usuall a hair dryer will fix that.

Subject: [DrakeRadio] Cleaning the Drake?

HI,
Are there any good sites on the web that talk about cleaning these radios?

I would like to give it a try for myself.

Or any suggestions from the list to get me started.
Thanks,
Dan

From: Garey Barrell
Topic: 88 Message: 96

Larry -

The weakness I have seen in my limited experience with the TR-3s and
early TR-4s has been failure of the "soupcan" filter. I suppose it
would be possible to repair by replacing a defective crystal with some
reverse engineering, but ... Inrad replacement filters are nice, but
too expensive to be practical unless the radio holds some sentimental value.

Aside from that, I suspect a transmitter with those filters wouldn't
come close to meeting the current FCC "Purity of Emissions" specs.
They're "grandfathered", but won't endear you to any nearby ham
friends. Plus of course the worst will end up driving amplifiers,
exacerbating the problem considerably!! :-)

I've attached a copy of the spreadsheet I put together to try and
visualize the TR-3/4 series for the CD I'm working on. I'd appreciate
any additions or corrections you might have. Thanks!

From: Garey Barrell
Topic: 99 Message: 99

Unique service information CDs available for the Drake B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Our group is still pretty new, however we over 60 members allready !
please feel free to use or upload links, pictures or related files to the Group home page.

I myself have only one Drake, a TR-7 with the PS-7 supply, and both are in rough cosmetic condition.
I was wondering about other list members, which models are being used?

My first ever radio was a heatkit HW-101, And I would eventually like to get a nice older Drake set. I can't help it , I like the glow !!

I've got a pair of TR-3s. One of them has lived a hard life, but works well, and has a -very- clean front panel. The second has had an easier time of it, these last 43 years. It has a companion RV-3, and has had the additional panel installed for transverter use. That combo has a tiny bit less sensitivity on RX, and a tiny bit more gain on TX.

Each of them has gotten me fine QSOs to Europe and the Carribean, with an indoor dipole.

I am considering offering them for sale, so if you're interested, email me...

From: Mike-K5VSE
Topic: 107 Message: 107

Hello to all,

My TR4 transmit just quit after being turned off and set for three days. Now there is no BIAS indicated. The manual says V4 is supposed to be an 6HS6 but the tube in the rig is an unmarked 9 pin miniature type. I can't find any markings at all on it. The BIAS voltage is around -58 volts. Screen voltage is close to the manual of 205VDC. When it is keyed, the S/ALC meter pegs! Any help on this one? I have replaced the driver, finals, and mixer. The receiver is just fine, so the PTO is operating right.

Any and all help greatly appreciated.

Thanks
Mike/K5VSE

Mike -

The final idle current requires only that there is plate voltage, screen voltage and bias voltage applied to the finals, and that the meter shunt resistor is good, and that the relay closes. No other tube has anything to do with the idle current, except for V19b, the 6EV7 relay driver. Bottom line, if there is plate and screen voltage on the finals, and the cathodes are grounded, the current drawn by the finals is limited only by the bias voltage on the grids... or the power supply!

So if the relay is pulling in, the finals WILL draw idle current. Most likely final cathodes are not getting to ground, or the screen voltage is not actually getting to the screens of the finals. There is an RF choke in series with both of these.

REMEMBER!!! There is 650 VDC in there, not to mention 250 VDC!!

Mike,

See if you can adjust the Bias voltage at all. It may be that you lost the Bias circuit. If that is the case repair it before you damage your finals.

I've learned to love De-Oxit. My TR-3 No.1 has needed to have its relay bathed in it. Symptoms: no transmit. If the relay contacts are dirty, they won't bring the transmit cathodes to ground, as Gary B. noted. Try manually grounding the cathodes, quickly, and see if the bias shows up.

650V DC hurts like hell. Don't touch it. Been there, done that, didn't want the tee shirt.....

Mike -

OK. The second relay (under the chassis near the Carrier Oscillator) is
to shift the Carrier Oscillator ~ 900 Hz for CW.

You should be able to do an ohmmeter check with power off to see where
it's getting lost.

The three 15 ohm, 1W resistors all connect to one RFC at the PA cage
under the chassis. An ohmmeter check across that RFC is where I would
start. Then you can check the _voltage_ from that point to ground
when you switch the transmitter to TUNE. You should hear the relay
close and any voltage up to screen voltage at that point should go
almost to zero. (Within 50-100 mV)

Mine doesn't use the 6FQ7, but uses an 6EV7 instead, but it is OK, as the relay closes when keyed or put into the tune mode.

Thanks

Walter -

Nope, the 6FQ7 (6EV7 in earlier models) is the relay driver tube. 6AQ5
is the audio output tube.

Garey
Have you come across a TR-4 that uses a 9 pin tube in place of V4, which according to my manual is supposed to be a 6HS6 tube? It sort of looks like it might be a 6EA8/6GH8 type, but there are no markings on this particular tube, so I am unable to identify it. The manual came with the transceiver, but now I doubt that it is the original. This must be one of the real early production TR-4 rigs. I bought one of the conversion kits from John Kriner to replace the relay with the later plug in type, but can't find it at present. I'm sure it will turn out to be the relay, and this afternoon I hope to get out to my shop and do further testing.

Thanks

Mike -

What is your serial number?

The TR-3 and very early TR-4s V4 was a 6HS6 (7 Pin). Before s/n 19500,
V4 was changed to a 6EJ7 (9 Pin) which continued through to the end.
Does yours have the "soupcan" (one piece) filter or the two separate
filters?

Mike,

Just looked thru my notes on my TR4CW. when it would not Key and XMit I had to change the 6FQ7 and D5.

Garey,

I had audio. I think that D5 rectified the signal and applied it to one half of V19 to key the XMit.

All I know is that when I replaced the two I was back in business.

The serial number is 19985

Now that you mention the 6EJ7, that's what it looks like. I checked the insides to another that I have in stock, and they both are identical. Thanks. Haven't been out in the shop to check the filter configuration yet, but will in the morning. Got to get some of this stuff out, as people are wanting to get their rigs back. Got a rush Kenwood 820 to finish up tomorrow.

Unique service information CDs available for the Drake B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

No plans for the SPR-4. I've never owned one. Perhaps if I come
across a good one at a hamfest.......

Currently I'm working on the TR-4, and if I ever finish that one I may
retire!! :-)

127. TR4 with not XMIT

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-10-01 21:59:41 UTC
From: Mike-K5VSE
Topic: 127 Message: 127

Well, thanks to all who provided helpful info. After I cleaned the relay several times, I finally saturated it with De-Oxit, and it's now working again. While I had it apart, checked all the tubes, cleaned the bandswitch and all controls. Need to wait for two 12BA6 tubes to arrive, as they did not check good. My manual does not aggree with the radio, as V4 is listed as a 6HS6, but actually has a 6EJ7 instead. It appears that after serial number 19500 Drake changed the tubes. Now, I need to locate a manual that matches my transceiver in case there are any more changes that are not apparent.

Keep up the good work folks!
73,
Mike/K5VSE

128. Need Help Connecting My TR-4Cw/rit, To a Collins 75S-1, and 312B-4

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-10-03 20:09:05 UTC
From: tngoatee
Topic: 128 Message: 128

I am brand new to Amateur Radio, and I am setting up my shack while preparing for my FCC licensing exams. I need advice so that I can do the following:

1. Use my recently purchased Collins 75S-1 (receiver) to monitor a 2nd frequency, by connecting it to my Drake TR-4Cw/rit.

2. I bought the Collins 312B-4 Station Control (it was selling for a reasonable price on ebay), in hopes that I could hook the 75S-1 to it, and run coax from the 312B-4 to a dedicated receiving antenna, and connect my Drake transceiver to a dedicated transmitting antenna. Or will the Collins gear be incompatible with the Drake transceiver? I do not want to load up my shack (and unnecessarily deplete my chk'g acct) with more than two redundant systems. I would think that two complete HF rigs would be adequate for the ECOMM volunteer work that I want to do. I want to be a radio user, not a collector (naturally, I will also contact the ECOMM group for their input).

3. I would eventually like to hook the 312B-4 into my own phone line, so it can be used as an autopatch for emergency communications (I am joining a local ECOMM radio group).

Bottom Line: Can I do this using the equipment I have just purchased?

Help,

Daniel

130. L75 - No output

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-10-13 04:24:30 UTC
From: Jim
Topic: 130 Message: 130

Hello:

I'm new to the forum, but not new to Drake equipment.

I've got an L75 amplifier that is like new, but won't transmit.

The 3-500Z tube is good, and the meter says the high-voltage is there. But when I key the exciter and put 30 watts into the amplifier, there is no output - no grid current, no plate current, no nothing.

To tell the truth, I may have accidentally tried to tune up without a proper load.

Can anyone give me a clue where to start looking? I've taken the cover off and there's no evidence of arcing or any smoked components. Are there any protective diodes that might have burned out? I'm thinking it is a simple fix, but I don't know where to start.

Thanks for the help! 73, Jim KM5M

131. FCC releases long-awaited "Omnibus" Amateur Radio Report and Order

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-10-13 10:55:06 UTC
From: Don
Topic: 131 Message: 131

ARLB019 FCC releases long-awaited ''Omnibus'' Amateur Radio Report and Order

ZCZC AG19
QST de W1AW
ARRL Bulletin 19 ARLB019
>From ARRL Headquarters
Newington CT October 12, 2006
To all radio amateurs

SB QST ARL ARLB019
ARLB019 FCC releases long-awaited ''Omnibus'' Amateur Radio Report and Order

Ending a protracted waiting period, the FCC's Report and Order in the so-called ''Omnibus'' Amateur Radio proceeding, WT Docket 04-140, was adopted October 4 and released October 10, 2006. In it, the FCC adopted nearly all of the proposed changes in the Notice of Proposed Rulemaking released back in 2004. The FCC has:

+ expanded the phone subbands in the 75 and 40 meter bands;

+ permitted auxiliary stations to transmit on portions of the 2 meter band;

+ permitted the use of spread spectrum on 222-225 MHz;

+ permitted amateurs to retransmit communications from the International Space Station;

+ permitted amateur licensees to designate a specific Amateur Radio club to receive their call sign in memoriam;

+ prohibited an applicant from filing more than one application for a specific vanity call sign;

+ eliminated certain restrictions on equipment manufacturers;

+ permitted Amateur Radio stations in Alaska and surrounding waters more flexibility in providing emergency communications;

+ clarified that ''amateur stations may, at all times and on all frequencies authorized to the control operator, make transmissions necessary to meet essential communication needs and to facilitate relief actions'';

+ deleted the frequency bands and segments specified for RACES stations;

and

+ deleted the requirement for public announcement of test locations and times.

In addition, the FCC took several other miscellaneous actions.

In ''refarming'' the frequencies currently authorized to Novice and Technician Plus licensees, the Commission increased the voice segments for General, Advanced and Amateur Extra licensees.

On 75 meters, Generals will be able to use voice from 3800-4000 kHz, an increase of 50 kHz. Advanced class licensees will be able to use voice from 3700-4000, an increase of 75 kHz, and Amateur Extras will be able to use voice from 3600 to 4000 kHz, a generous increase of 150 kHz.

On 40 meters, Advanced and Extra Class licensees will be able to use voice from 7125-7300 kHz, an increase of 25 kHz. General class licensees will be able to use voice on 7175-7300 kHz, an increase of 50 kHz.

On 15 meters, General class operators will have phone privileges on 21275-21450 kHz, an increase of 25 kHz.

ARRL President Joel Harrison, W5ZN, expressed the ARRL's gratitude to the FCC Commissioners in a letter dated October 11: ''On behalf of the ARRL and the Commission's licensees in the Amateur Radio Service I want to express appreciation for your release yesterday of the Report and Order in WT Docket 04-140 (FCC 06-149) amending Part 97 of the Commission's Rules. The Commission's action in clearing this pending proceeding will assist the Amateur Radio Service in meeting its objectives, particularly with regard to providing emergency and public service communications.''

The changes will go into effect 30 days after the R&O is published in the Federal Register.

Wouldn't it also be reasonable to allow Advance class to use the lower 25kc of cw on 40/80? After all, they are 13WPM operators, this is a cw portion of the band, most Extra class are 5wpm operators and they get the use of the lower 25kc, I'd rather that the phone portion.

Larry, Don:

Thanks for the suggestions.

I just haven't had time to troubleshoot any further. I hope to get to it this weekend.

I'll report the results on both forums.

George,

www.harbachelectronics.com/

Look in "Other Parts" for the SPH type resistors for the L-4PS.

Now, the important question...Why did it pop? It is a fuse to prevent destruction of the diodes if something goes in the amp.

George -

The BWH resistor is no longer made. The IRC SPH resistor is sold as a "direct replacement" for the BWH, but we don't know if Drake relied on some "undocumented" specification when selecting the BWH! As you found out, the BWH explodes when the HV in the L-4B is shorted, even momentarily (as from a tube flashover,) and we hope that the SPH reacts the same way! Unfortunately IRC doesn't specify the "explosion" characteristics of either type.....

Anyway, Jeff, W8CQ at Harbach Electronics

<http://www.harbachelectronics.com/>

sells the 0.82 ohm at 2W in SPH at five (5) for $5.00.

By the way, there is a school of thought that this resistor should be able to aborb the fault current (without exploding!) long enough for the primary circuit breaker to pop, and should therefore be made larger. YMMV.

143. Headphone jack on R-4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-11-01 22:18:03 UTC
From: Curt Phillips
Topic: 143 Message: 143

I had an R-4A for my first "General Class" receiver (w/ a T4X) from 1970-1976. I now have an R-4B.

I note the R-4A & R-4C had the headphone jack on the front panel, while the R-4B does not. Does anyone know why? It just seems strange that they would make the change for this one model.

It's not important, but I'm just curious.

Curt -

I think they made a mistake, and corrected it! There are quite a few R-4Bs WITH a front panel phone jack too..... I know of two that I modified back in the 60's. The centerpunch mark was on the B front panel, (a tiny circle,) and the hole was also present in the chassis. It was simply a matter of drilling the front panel for 3/8" on that center, mounting the new jack, and moving one wire.

They obviously responded to customer concern and moved it back to the front on the C Line!

One factor in Drake's favor.... A phone plug inserted in the front panel PHONES jack makes it a little awkward to access the RF GAIN and the MODE switch. This is most likely why they moved it to the side originally..

148. Help! 2B - bands over 14 MHz inoperative

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-11-08 03:44:25 UTC
From: carl solomon
Topic: 148 Message: 148

I need help with Drake 2B which won't receive above 14 MHz band. I'm wondering if the plug-in crystals may be a little scrambled in their slots, a defective crystal, or maybe bandswitch problem(?). In 15M or any of the 10M bandswitch positions, I get weak receiver hiss but can't peak on a signal, including the calibrator. 80M, 40M and 20M work just fine.

Would someone out there be kind enough to provide me with crystal frequencies and slots they should be plugged into, for normal setup of the radio?

Many thanks and '73

Carl -

Here is the chart for the crystals. You'll note that only three crystals were provided with the receiver from the factory, plugging into the sockets marked "40" (11.0 MHz), "20" (18.0 MHz) and "10v2" (25.0 MHz). The 25.0 MHz crystal serves for both 15M and the 28.5 - 29.1 portion of 10M.

If the crystal IS present in the 10v2 slot and is 25.0 MHz, you might try a 6EA8 in the V2 position. This tube has higher gain than the original 6U8, and often will "revive" sluggish crystals.

have a Drake UV-3, fully functional, with all 3 bands, the Drake PS-3(?) power supply for the UV-3, and a brand new, in the box remote mounting mobile kit for the UV-3. The radio works great and until recently, it was my only VHF/UHF radio. The top is the sticky rubber stuff and looks its age. The back light for the s meter is out. Other than that, it's perfect.

As this radio and accessories are not being used, I thought I'd use it as partial trade for an R-7 or R-7A. Am I dreaming or do you think this is good substantial partial payment?

Garey -

Many thanks for the info. I tried your suggestions, but darned if it still doesn't work. Thinking that maybe my 25 MHz crystal might be defective, I tried it in the "D" slot, with bandswitch in "D" position and I could peak some calibrator signals. But no response on 15M or any of the 10M switch positions while that X-ral is in 2nd 10M slot. There is hiss and faint calibrator signal but nothing that preselector will peak on.

I also traded a 6EA8 for the 6U8 but no difference there either.

Any other obvious possibilities come to mind? I may start to think about a defective part of bandswitch...ya' think?

Again, many thanks and '73!

From: Garey Barrell
Topic: 99 Message: 152

Unique supplemental service information CDs available for the Drake B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

153. Restoration questions

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-11-13 14:29:12 UTC
From: cdsol111
Topic: 153 Message: 153

(To Garey - THANKS for the help in getting my 2-B back in action...electrically now works great.)

This is something that's probably been addressed before, but when restoring old radios (Drake or otherwise) is restoring the cabinet a "do-it-yourself" thing, or is it best left up to being done professinally. Is it OK to attack the pitted and rusty spots with a whiz-wheel, strip the paint, apply primer then spray paint?

How 'bout the chasis, accumulated dirt, and especially the darkened areas on the copper? What's best way to free up stiff rotary switches...what kind of cleaner or lube?

I'll bet there's a website or book that goes thru all this...I just haven't seen it.

Thanks!

Carl - W5SU

Date: 2006-11-13 15:21:31 UTC
From: Garey Barrell
Topic: 153 Message: 154

Carl -

You're welcome!

The 2-B cabinet is one that lends itself to home rework. Rustoleum #7777 Satin Black is a VERY close match to the original color and sheen. The front panel is a different problem, of course. It would be a very easy silk-screen to make, flat panel, single color, etc. I have a friend locally who looked into doing it, and found someone who would burn a screen for him (using his provided artwork) for $60. He hasn't done anything yet. I spoke with the guy who is making the 4 Line repro panels, and he said that he didn't believe the market would be sufficient to justify the expense. Dee, W4PNT, who does the Johnson rework said essentially the same thing. I don't know if Frank (my friend) would be interested in getting together a bunch of panels for a one time shot. You can make a lot of panels from one screen, but they don't clean and store very well, making it best if you do all you want to do at one time.

The copper is a different problem. Frank has tried plating with the little brush plating systems. The problem is that newly plated copper doesn't have that "patina" that converts it from a "new penny" copper to "old penny brown". Some have used paint, available from craft stores, and some have gone to further extremes.

<http://www.wb4hfn.com/DRAKE/DrakeArticles/ChassisCleaning/ChassisCleaning.htm>

Both methods though are "repairs" rather than "restorations", at least in my opinion.

Rotary switches are usually stiff because the lubrication that was originally on the ball detent assembly is long gone. A little Lubriplate or other white lithium grease will go a long way to freeing them up. A drop of light oil on the shaft bushing is also a help. I would strongly advise against trying to "mechanically" clean rotary switches with Q-tips or other tools. The fixed contacts especially are fairly delicate, and can be "sprung" very easily, destroying the contact. The black coating on silver switch parts is Silver Sulfide, which is nearly as conductive as silver and very soft. If you look closely at a blackened switch wiper, you'll see a bright silver line where the fixed contacts have scrubbed off the black. Silver "cleaners" ALL work by removing the Silver Sulfide, either by chemical or mechanical means. Unfortunately, Silver Sulfide consists of some of the silver plating! Meaning you are removing some of what is often a fairly thin layer of silver each time you use these products. Much better is to use a good quality contact cleaner such as DeoxiT D100L LIQUID, and

apply a small amount directly to each switch tag. Do NOT use a spray cleaner on phenolic (brown) rotary switches. SOME solvents will damage SOME phenolic wafers, causing them to swell and distort.

Control potentiometers are best cleaned with DeoxiT CaiLube spray. A small spritz inside a pot will clean and lubricate it, making it quiet, and feeling like new. This same product works well on the Drake slide switches, again a SMALL spritz frees them up.

There is a LOT of good information on the WB4HFN website, referenced above. Well worth spending some time looking around.

Subject: [INRAD] Announcement

ANNOUNCING THE SALE OF INTERNATIONAL RADIO

George, W2VJN and Georgia are pleased to announce that effective January 1st, 2007 International Radio will be under new ownership. We wish to thank our many customers for their business and friendship over the almost ten years we have owned this company. We have learned much and worked hard, and it has all been good, but it is time for us to look ahead.

International Radio will be in the very capable hands of new owners Trey, N5KO, and Mark, AG9A. Trey and Mark are dedicated radio amateurs who appreciate all aspects of this hobby - especially contesting! They have ideas for the future, and they will not only sustain Inrad; they will improve it. We look forward to helping them succeed in any way we can. In particular, George will stay involved in the development of new products.

For more than two years we have been assisted by Laurie, our employee extraordinaire. Many of you know her and we know you join us in thanking her for her hard work and dedication. We will keep her as a valued friend.

Our final day in business will be December 15th, 2006. International Radio will then be CLOSED until January 1st, 2007. Watch the website for the announcement of the annual New Year's Day Sale.

158. FS: Unique Drake Service Information

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-12-02 20:20:39 UTC
From: Garey Barrell
Topic: 99 Message: 158

Unique supplemental service information CDs available for the Drake B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

160. TR-4 with no mute in X-Tune

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-12-06 23:45:11 UTC
From: Mike-K5VSE
Topic: 160 Message: 160

Hi to the list,

The TR-4 first quit transmitting after using it one night. The next day it would not transmit at all. Turned out to be the relay of course. Use it from time to time, and yesterday, I decided to try it out again. When you go into the X-tune position, it tunes, but will not mute the receive section. Re-checked the relay and all is well. Anyone got any suggestions on this one? It's a first for me!

You can respond here or off list at k5vs@... if necessary. I don't always check this list on a regular basis.

Thanks in advance for any help. BTW, the rig works fine as it is, but the lack of muting is troublesome.

Mike,

Does your model of the TR-4 have the Rcx/Transcive switch on the side? I s
make sure that the switch is in the transcive position.

Well, I learned a lesson. When you loan a piece of equipment to someone who is not used to using these old rigs, check everything simple first. What I found, was he had turned the side tone all the way to the max, and I only thought it was not muting while I was trying to tune it up. Live and learn I guess. Sorry for the trouble I may have caused some of you, and to those who gave me some suggestions, thank you very much. I have moved it from the shop to the house and will have it on the air tonight.

Proposed New 80 meter Bandplan for USA

3500-3540 = CW
3540-3560 = 500Hz BW All Modes.
3560-3580 = 500Hz BW All Modes. Including Auto.
3580-3600 = All Modes. Including Auto.

Proposed New Calling Frequencies
3539 QRP CW
3545+ PSK31
3548+ PSK63, MFSK16, Olivia500, etc
3552+ Hell, etc
3555+ RTTY, FSK, etc

Topic: 165 Message: 166

Thanks for the response. I realize the ARRL plan will probably carry
the day, now that they have presented it. What I posted was out before
this, and just had me asking questions, as I use these modes (primarily
psk), and realize some changes were needed. I did not intend to add to any
confusion, my hope was to clarify/ generate a definite answer as to what the
new band plan would be.
ARRL's new bandplan
80 Meters (3.5-4.0 MHz):
3.590 RTTY/Data DX
3.570-3.600 RTTY/Data
3.790-3.800 DX window
3.845 SSTV
3.885 AM calling frequency

Thanks again,
Don

Subject: Re: Fw: deathmatch PSK question 80M freq?

The proposal quoted below was from one person representing a special
interest group (Winlink). It does not in any way reflect a consensus
among amateurs at large, nor is it likely to be reflected in actual
practice, since it would be totally inadequate to accommodate current
CW and RTTY traffic nets, etc.

For the revised ARRL bandplan after the December 15 change, see
<http://www.arrl.org/FandES/field/regulations/bandplan.html>. The
former RTTY segment at 3.580-3.620 MHz is now an RTTY/Data segment at
3.570-3.600 MHz. This means that past practice for PSK31 (3.580 kHz
plus audio offset) could continue, or PSK31 could move down as much
as 10 kHz to 3.570 MHz plus audio offset to get away from the W1AW CW
code practice.

I have a Drake TR7 which has distorted audio on transmit, it is like the radio is being overdriven, however even with the mic gain way down the audio is better, but still distorted. The audio is high, tinny and scratchy, if that makes sense. I have tried a couple of different microphones with the same result. Where do I start with this one fellows? 73 Geoff

I would hope others may have had expereince with this problem and will help out. for myself, it is a new one.
Do you have a good copy of the service manual?
I have found that by following the alignment procedure all the way through an help to isolate the section that may be causing the problem. and sometimes, just re-aligning can help or even cure these kind of problems.
please keep us up to date on any findings.

I would like to take a moment and say thanks to those who joined this group! Our group is still pretty new,
and slowly growing. For those whoe are meore recent to the group, this one was started in response to the older , bigger group was allowing a lot of spam e-mail , and that groups owner was no longer around.
So , hopefully, with time and letting others know we are here, this group will grow a little larger, to where we might be even more helpful in regards to the care and feeding of these great Drake radios.
Again, thanks to all in the group,
And Merry Christmas!!

171. Fw: An EE's 'Twas the night before Christmas

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-12-24 23:52:49 UTC
From: Don
Topic: 171 Message: 171

Electronics Engineer's
T'was the Night Before Christmas

'Twas the night before Christmas and all through production,
We were measuring currents and checking induction,
Capacitors mounted, diodes seated with care,
In the hope that the circuit soon would be there.

All ICs positioned, each pin seated right,
Our soldering irons were turned off for the night,
Transistors were stowed, not a circuit was shorted,
And resistors all packed, by ohms they were sorted.

But still one more task lay ahead, just for me -
Another few hours on my new PCB,
Just for good measure I gave it a poke,
And the 15 volt rail went up in grey smoke.

Electrolytic capacitors popped and went bang,
Resistors went meltdown, connectors snapped with a twang,
The PSU - open circuit, the current killed diodes,
So I snatched up the solder and reached for my probes.

I pulled out my meter, I prodded and twiddled,
First blew out the ground rail, then re-routed and fiddled,
An inductor coil here and there a resistor,
Transplanted an IC, cross-connected transistors,

A diode reversed and an upgraded cap,
A little more solder to bridge a small gap -
My tolerances tiered to the umpteenth degree,
But still it lay lifeless, that damned PCB!

Then out in the main lab I heard such a clatter,
I tore off my wrist strap to find what was the matter -
In the anti-stat bay a fine sled had appeared,
With reindeer and earth-strap and a man with white beard.

His fine stamping reindeer were led, I did see,
By one whose nose was a bright red LED;
Trimming their harnesses were components and bits,
Bright coded resistors and surface-mount chips.

The white-bearded man tipped open a sack,
And like jewels some components trickled out of his pack,
With a nod and a wink he heated my iron,
And laid down a fresh circuit of finest gold wire.

Some ICs he placed with great care on the board,
Along with transformers from his own gleaming hoard,
The board was soon finished, held up for inspection,
All test points in place, all power rails checked on.

Then he gathered his meter, his twiddlers and tools,
Scooped up the components which lay like bright jewels,
Gave me a handful and said with a wink,
"I've twiddled the RF, please see what you think."

Then his sled with its diodes all flashing and bright,
Clattered out of the anti-stat into the night,
Just 'fore he vanished he reached over his shoulder,
Threw me a new wrist-strap and a big reel of solder.

"On Henry! On Farad! On Voltage and Ohm!
On Ampere, Transformer, reverse-fitted Diode!
We've surface-mount circuits and more things electronic!"
As he took to the skies and went supersonic.

But I heard him exclaim as he vanished from sight,
Merry Christmas to all, and to all no short-circuits tonite!!

172. Wrong manual for my R4-Ca

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-12-25 18:59:01 UTC
From: Mike-K5VSE
Topic: 172 Message: 172

Merry Christmas to all!

I was using my Drake R4-C the past couple of days, and the signal strength seemed to going down. So I pull out the manual to determine what tubes I should start checking. Well my manual says there are supposed to be at least three 6EJ7 tubes in the thing. Mine does NOT have any 6EJ7 tubes at all. It uses 6BA6's, 6BE6's, and 6HS6's. So, question is: Do I have either an earlier version, or a later version of this receiver? I guess I need a manual for whatever version I have.

By the serial number I believe it is an early version. Ser # 16929

Any help will be kindly appreciated.

Thanks es 73,

Mike/K5VSE

Let me know if you find a fix for it. I have a R-4C doing the same thing kinda sorta. RX works ok some times then falls out. Overall receive is not great either when its 100% working. I see that there are 2 low level rca's that connect the osc and rx ant. Does yours have that from that transmitter to receiver or is that unit you have a transceiver? I am going to change to either rg-58 or rg-62 cable to see if the sensitivity goes up. I am using a home made preamp to make it a tad better. I am not familiar with the Ca version.

Bobby,

Mine is a complete set of Drake twins, the "C" line, not a transceiver! I think, from reading some of the posts on this and other places, that the INJ cable is more or less critical. Seems I've heard RG-62 will work, but length has an effect on overall performance. There are cable sets that are listed from time to time on the "E" place if you want original replacements. But, I don't think it's a cable problem. I have stopped my problem by removing all the cables, and cleaning the sockets and cable ends using De-Oxit. Now I no longer have the problem. Might have just been pure luck on my part. I'll give it a few days to see.

176. Drake color VHF wattmeter FS

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2006-12-30 15:04:29 UTC
From: Ken Simpson, W8EK
Topic: 176 Message: 176

For Sale:

Heath HM-2102 VHF wattmeter in Drake color

It covers 50 to 160 MHz, with 25 W and 250 W
full scale. It can also be used to check SWR, and
has a remote sensor that can either be left inside
the meter, or separated from the actual meter.
SO-239 connectors in and out.

This particular meter looks different, however.
The cover has been painted to match Drake
equipment. The cover is black, similar to the
Drake TR-4, 4 line twins, etc. If you like Heath
green, it is ugly; if you like Drake black, it is fine.
Paper work included for $40.

Drake 1525 EM Touchtone Microphone
This is the mic that was used to add a touchtone
pad to a lot of rigs in the 70s and 80s. Normal
hand mic from the front, but has a touchtone pad
on the back. Four pin mic plug.
It is in good shape and includes paper work. $ 40

Prices do not include shipping from Florida.

Thanks.

Hi Jeff,
I have a TR-3 available for parts or repair. I believe
the crystal filter is bad. I can tune stations no
matter what the position of the sideband switch. The
finals are good, this would give you an extra set of
finals. Two of the 12BA6 tubes did not light up. I
tested with two from my spares and the receiver works.
I will keep my 12BA6's, but you will get all the other
tubes including a new driver I installed. The front
panel is in excellent condition.

Hello Jeff,
How about $60.00 + shipping costs. I believe UPS
Ground will be the least expensive shipping. I guess
around $20-$25 for shipping, but I will not know for
sure until it is packed and I have your address. To
keep things simple, I will accept a check or money
order for $80.00 for the TR-3 and shipping. If you
send a check I will wait for the check to clear before
shipping. Is that a fair deal?

Hi Francis,
That sounds fine to me. It will be a couple weeks at least; we are waiting for a house-closing and are not sure how much money we will have left over.
It sounds like the parts rig will be my own, and yours will be the fixed one. It would be a major operation to swap the band switch assembly over to mine, and anyway, the VFO does not work on mine either. I can only RX when using the exernal VFO.
I will get back to you...

F Broussard <d104_1@...> wrote: Hello Jeff,
How about $60.00 + shipping costs. I believe UPS Ground will be the least expensive shipping. I guess around $20-$25 for shipping, but I will not know for sure until it is packed and I have your address. To keep things simple, I will accept a check or money order for $80.00 for the TR-3 and shipping. If you send a check I will wait for the check to clear before shipping. Is that a fair deal?

182. HELP!

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-01 21:22:27 UTC
From: Garey Barrell
Topic: 182 Message: 182

I need a little help. I'm working (still !) on the TR-4 Series CD, and there appears to be yet another version schematic or two, other than the eight I already have. All my usual sources have come up dry, including Drake, which had only TWO of the eight known versions.

The earliest TR-4 schematic I have is 256619500, which translates to 2/5/66, s/n 19500 and up. The _First_ TR-4 schematic would be sometime in 1965, probably around s/n 15000. That is the one I am looking for.

The earliest TR-4C schematic I have is 3147435161, which translates to 3/14/74, s/n 35161 and up. The _First_ TR-4_C_ schematic would be sometime in 1972, probably around s/n 32000. That is the one I am looking for. It's possible that there are one or more additional versions between 32000 and 35160, but I'd be happy to find just the one around 32000!

SO ! If anyone with an _original_ Drake TR-4 or TR-4C manual would check the version number on the schematic, I would very much like to find one or both to include in the CD.

The first person who comes up with an original for loan or purchase of either or both of these "missing links" will be entitled to a free Drake Service Supplement CD.

Thanks for looking!

Larry -

Yeah, that's the last one I know of.

Here's the chart (so far) that will go on the CD.

Garey,

I have an original TR-4 manual. Same number as yours 256619500

I have an original TR-4Cw manual, the schematic says TR-4C and is
number 11017642500

I have an original TR-3 manual, number 6186410000

Any of this help?

John KB4CRT

Hey Larry,

I have my Drake "C" line as you know. Well, it started giving me a little trouble with receive, and I looked at my manual and decided that possibly the RF amp tube might be going bad on me. I ordered a few tubes for the rig according to the manual. When I took it apart, it had different tubes than what the book called for. (I got the manual when I bought the Drake rigs.) My manual says there were at least three 6EJ7 tubes in it. Mine does not have any at all, but in their place it uses 6HS6, 6BE6, and 6BA6 tubes. My serial number is 16923! I have to assume that is an earlier version, and the changes were made during later production runs. Can you give me any idea as to how to go about finding the correct manual? I might get hold of John Kriner, Bill Frost, or possibly Gary over in Georgia to see what they might suggest or have available.

Thanks buddy,

The best source for info is Garey's CD on the C Twins. I have one and
it is the best way to find your way around the Twins. Yours is an early
one with the 6HS6's. Have a good grip on your wallet, those 6HS6 tubes
are getting scarce and $ going up.

189. TR4CW/Rit WILL NOT TRANSMIT

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-02 16:56:25 UTC
From: Walter Milton
Topic: 189 Message: 189

Happy New Year All!!

With today off I though that I would put the TR4CW/Rit inline and have some fun on the lower bands. So after setting up and let the rig heat up for 15 minuets I switched in the dummy load to tune up. I have side tone but no amp reading. On listening closely I could not hear the relay close. So off with the cover and I replaced the 6FQ7 with a NOS spare. After five minuets, keyed up and still no relay closure. Off comes the bottom cover. Checked diode D5, it checked good (but I replaced it later on). I could see nothing burn or smell any strange odors. So I started looking over the schematic:

1. Pin 1 - 47 VDC
2. R102 - 225 VDC
3. Cathode of D5, unkeyed -11 VDC, keyed +42 VDC; anode -13 VDC (keyed or unkeyed)

The voltage on D5 (keyed) does change with the VOX pot. Here is the strange part, resistor, R102 100K, the old one measured 92.5K after lifting one leg. Replaced it with a new one same value and wattage (97.8K). On both I have 227 VDC on top and 57 VDC, unkeyed 77 VDC keyed. Is this what I should see??

I also changed V17 6AQ5, this made no change. What am I missing?

I am open to any and all suggestions.

Thanks,
Walt. , KA2NJF

All,

Success, I pulled the relay and checked its' coil, checked OK. After replacing the coil I turned the TR4CW/Rit back on and after five minuets switched to CW and the unit keyed. I do not know what if any thing I did but it works.

Thanks,
Walt. , KA2NJF

Thanks Larry,
I might go ahead and buy the CD. I still want to find an original manual though, because it will match all my Drake stuff correctly.

Yeah, you do need an original manual just for having it. The real value in Garey's CD is the location of every part is shown and saves hours of tracing time. For you slowpokes living in the great frozen north it could be weeks.

Where do you come up with the great frozen north? I'm only in Arkansas, and it's 48 right now. But, we were all white this morning, because it got down to 2? something last night.

I'll keep looking for the right manual, and sooner or later it will appear.

See ya on 22

I might have it(?). My TR4 Ser # is 26729. My copy of manual (don't know whether originally for my specific TR4) has schematic with numbers: 156726000. Could that be it? By the way, the 2-B still working like gangbusters - thanks)

Speaking of manuals, Larry or anyone where can I find a copy of a TR4CWR/it manual. On close inspection the manual I have is for the TR4C.

Thanks,

Walt., KA2NJF

Yeah, you do need an original manual just for having it. The real value in Garey's CD is the location of every part is shown and saves hours of tracing time. For you slowpokes living in the great frozen north it could be weeks.

Carl,

Where on your schematic did you find that number. I have looked all over my manual and as of now have not found any think like that.

Thank,

Walt -

There is no manual for the TR-4Cw/RIT. The manual you want will have
schematic 11017642500 and be for the TR-4Cw. There is a two sided sheet
covering the RIT board which is the only difference between the two.
The schematic will be on the CD (eventually) but I'll send you the scan
for the RIT sheet. I don't think the list allows attachments.

No, that's one I have. I'm looking for one that _should_ be in 1965,
around s/n 15000. That IS the correct schematic and manual for your
unit though!

Glad the 2-B is still alive and well.

Thanks for checking!

Thanks, there is no need to at this time.

Thank Garey, I found the number!! Now that I know where it is I do not know how many times I may have looked at it and did not know what it was. My serial number is in deed 11017642500.

Garey thanks for the two files they were not needed. I have copies of them in the techn manual.

201. 2-AQ, 2-BQ and 2-CQ

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-05 01:32:56 UTC
From: Dennis Todaro
Topic: 201 Message: 201

I have a Drake 2-A, with 2-AQ, Drake 2-B, with 2-BQ and Drake 2-C, with 2-CQ. I find that the 2-BQ does provide some peaking and nulling as I tune and adjust it. The 2-AQ is not quite so sharp but still quite helpful in tuning and selecting signals. The 2-CQ really does nothing more than a placebo effect, making me think something is happening by the power of suggestion.

Is this stuff showing its age? Am I showing my age? Am I expecting too much?

Is there something I can do (e.g. changing the tube) to improve the performance of these dandy accessories. I like the speaker consoles regardless and the receivers all perform wonderfully well in tandem with my vintage transmitters. It would be nice if turning on the "Q" was like a secret weapon to peak up the desired signal and vanquish the QRM.

Any comments? Suggestions?

Thanks and 73

Dennis, WQ7O

Dennis -

All three units are identical and fully interchangeable. I suspect you have some weak tubes, or someone has been "fixing" one or more item in your collection. You could try mixing and matching for a start to see if the problem is within the Q-Multipliers or the receivers, i.e., plug your 2-AQ into the 2-B and see if it works as well as the 2-BQ and vice versa. Then plug the 2-CQ into the 2-B and see what happens. It's quite possible that a good alignment per the manual would make them all work as well as the 2-BQ.

The Q-Multiplier certainly WAS a "secret weapon" in the 50's and early 60's for receivers with 455 kHz IF's. Properly adjusted, they could make even the widest receiver seem "single-signal". You might not have much in the way of skirt selectivity, but quite often the 10-15 dB peak provided by the Q-Mult would enable you to pick one signal out of the hundreds crammed into the old Novice band!

> Abstract.
> The Drake TR-7 is an outstanding all-band, solid-state transceiver that was
> a trendsetter when it was unveiled to the amateur radio market in 1978. > However, the
TR-7 was not without its problems, some of which included:
> Poor receive performance below 1.5 MHz
> No full break-in (QSK) CW operation
> Compromised signal/noise ratio when using narrow CW filters
> High cooling fan noise, and the stock fan operates only when the radio is
> powered from an AC source
>
> My article, which originally appeared in the Summer, 1992, issue of
> Communications Quarterly, addresses these four problems with modifications
> that require no drilled holes, making them 100% reversible.
> Notes
> Improving the TR-7 is reprinted here in its entirety, and it appears on the
> Web with the permission of Communications Quarterly. I scanned the original
> 19-page paper and converted it into an Adobe R PDF file. The size of this
> file is approximately 1.9 MB, so it will take a while to download if you are
> using dial-up Internet access. For! exampl e, at 28.8 kbps it took me about 14
> minutes to download the file.
> Component Availability
> At the time that this article was written, all of the components required

Subject: [drakelist] FS: Excellent TR-7A with PS7 power supply

List --
I have for sale an excellent Drake TR-7A, SN 115XX with the PS-7 power supply.
This unit has completely been serviced by a Drake technician. Reason for selling:
Downsizing.
$700 + shipping.

I am interested in acquiring a JRC NRD-515, NRD-525, or JRC- NRD-535 receiver. I can pay cash or can trade w/cash a Drake 2B/2BQ with xtal calibrator in very nice cosmetic/ operating condx and/or a Drake SPR-4 that has recently been serviced and is in excellent operating condx and nice cosmetic condition. Tnx for reading. 73, Joel AE2JL

Hello,

Does anybody have one available? Any ideas on where I could find one.
Tnx, 73 Joel

209. R4B Halp?...low sensitivity

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-17 15:12:33 UTC
From: steve_n0tu
Topic: 209 Message: 209

Just starting to restore a R4B. I need help with the following issues:

- Wicked AC hum on the audio. Assume I can just replace C90A/B/C/D cap and it goes away?

- CAL signal is almost unaudioable, down in the mud? I remember on previous R4s I could use the CAL sig to peak the preselector and seeing S9+ from the CAL sig?

- Overall the sensitivity seems a little low? Audio seems a little distorted? AND mostly notibly the AVC action is not happening? Signals just jump out at you?

- PTO gear drive is little gritty in spots?

comments/suggestions appreciated! Tks Steve

Steve -

Start by replacing C90. Also replace C91 and C192 while you're at it.

THEN evaluate the receiver.

The PTO front bearing should be washed out with solvent and regreased with Lubriplate or other white lithium grease. I'd also clean the lead screw and ONE drop of light oil. Clean the rider bar (chrome bar at the top that the follower rides on) and do NOT lubricate. These steps are easiest to do with the PTO out of the receiver, but can be done in situ. Either remove or protect the dial disk during the cleaning process, it's essentially not replaceable.

Get the power supply caps changed first including the - supply. Then check voltages. Then tubes. PTO take apart and clean. No oil on the nylon gears. NONE, NADA ! Only a tiny drop on the threaded shaft and bearing.

Sounds like a nice winter project.

214. Microphone Recommendation for TR-4CW

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-17 21:11:03 UTC
From: Charlie Seymour NJ3A
Topic: 214 Message: 214

I just obtained a TR-4CW, cleaned it up, plugged it in and it seems to work fine. I've checked the tuning dial against my IC-756 ProII and made some minor adjustments and all is fine. It wasn't too difficult...I'm old enough to remember slide rules...and how to use them.

I unfortunately did not get a microphone with it...from the SK's family...so I'm only in receive mode.

This is my first real tube transceiver and I'd like to get some recommendations on a microphone...without breaking the bank...

I'll probably use this rig on the low bands, wire tuned with my AT4K. Since I don't have a mic. I can't tell the output, but from the condition and sound of the rig on receive, I expect it to be pretty good.

Charlie NJ3A

This is just my personal opinion, but I found the Shure 444D seems to provide the best audio for a minor hit to the pocket book. I use one on both my twins and the TR4-C with great audio reports. I have been told on occasion that I have the best sounding rig on the band.

I have used: 5 Minute Epoxy System by ITW Performance Polymers in
Riviera Beach, FL.

This is a clear 2 part epoxy in the twin tubes with the dual pistons to
dispense the stuff. You have to make sure the parts are clean and free
of contact cleaner, etc. Clean with alcohol first. Just a small drop
on the phenolic and hold together for a moment until it starts to set.

I would recommend the Electrovoice 638 or 630 dynamic mic, good bass, natural sound and over all tone, more punch than the D104. I have also used the D104 with the ceramic cartridge but did the 47K resistor mod in the microphone head to the red wire to better round out the audio, less tinny...

221. T4XC problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-23 10:33:45 UTC
From: jeu3pneu
Topic: 221 Message: 221

HI all;

I have a late serial T4XC that goes into transmit mode c/w sidetone as soon as the mode switch is placed in the CW position. AM & SSB positions are fine but on CW the rig keys up with or without a key in the key jack. There is no CW output until you close the key contacts.

Tube substitution of V-10 and the VOX preamp tube do not help.

All 5 diodes on the CW line and VOX circuit were replaced with new ones.

This is a 6FQ7 Vox tube version.

Anyone else solve a similar experience and can shorten my bench time?

Thanks in advance!

Martin

Martin -

Have you checked CR15? If OK, check C107 by paralleling it with a
similar cap.

The KEY jack is a "shorting" type, i.e., with no key plugged in the
transmitter is Keyed when in CW.

I checked
CR15 OK
C107 OK
R 96 substitute for 960K
R102 substitue for 960K by previous owner
V10 resistance on tune mode is 1.2 meg NOT 2 Meg ?
all diode OK
any other idea ?
Tnx for help

What is the setting for the CW DELAY pot? See if turning it either full
CCW or CW will cause the relay to drop out.

Check the voltage on Pin 7 of V10 with a high impedance (11 M) meter.

It's Official! Morse Code Requirement Ends Friday, February 23
NEWINGTON, CT, Jan 24, 2007 -- Circle Friday, February 23, on your calendar. That's when the current 5 WPM Morse code requirement will officially disappear from the Amateur Radio Service Part 97 rules. On or after that date, applicants for a General or Amateur Extra class Amateur Radio license no longer will have to demonstrate proficiency in Morse code. They'll just have to pass the applicable written examination. The appearance in today's Federal Register of the FCC's Report and Order (R&O) in the "Morse code proceeding," WT Docket 05-235, starts a 30-day countdown for the new rules to become effective. Deletion of the Morse requirement -- still a matter of controversy within the amateur community -- is a landmark in Amateur Radio history.

Drake 2C - original finish, very nice cosmetically, operates well with 2-NB noise blanker, four accessory SW band xtals in addition to ham band stock xtals. I will include manual copy. Price, $195 plus shipping or $245 plus shipping with a MS-4 speaker also very nice condition(no scratches).

I've got a TR-4CW that needed a microphone. I found a D104 on ebay and now need to wire it to the Drake plug I have. The plug side is pretty simple, the D104 side has lots of connectors and wires. I'm just not sure which is which. Any help from the group would be greatly appreciated.

Thanks,
Charlie

Do a web search (Google) for "Astatic D104 microphone" and you will eventually come to sites that have the wiring diagram for the TUG9 amplified base for the D104. You don't need to use the amp in the base as the D104 crystal element has enough output to directly drive the mic input of the Drake.

What you want is shield to the sleeve of the plug, PTT to the tip and mic to the ring. In the base the other side of the mic goes to the shield along with the other side of the PTT switch. Direct connection of the mic lets you use VOX if you want. You'll need to sort out the base wires going up the tube to the mic and the PTT switch with an ohmmeter as the color code was not consistent.

A simple test of the mic is to hook your digital VOM to the two mic wires, set the meter for low volts AC and give a "HOOWIE" into the mic. You should see 100 to 200 millivolts (0.1 to 0.2 volts) on the meter.

Make sure the jack on the TR-4CW is properly wired too as I have seen several modified rigs where the mic and PTT were swapped because the owner converted the jack to the common 1/4 inch phone plug rather than find the 0.209 diameter plug that was used by Drake.

The reason the PTT is the tip and mic is the ring is to prevent the PTT voltage from being momentarily connected to the mic if you plug in the mic after the rig is on.

233. Voltage Rating for Drake 2C

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-28 17:49:12 UTC
From: ae2jl
Topic: 233 Message: 233

I have a 2C and I've noticed that the voltage rating is listed
as "120VAC". My other receivers, 2B, R-4B, are listed as 120/240 VAC.
Is this a misprint or was the 2C only rated for 120VAC?. 73, Joel AE2JL

234. Re: [DrakeRadio] Voltage Rating for Drake 2C

Topic: 233 Message: 234

Joel -

The early 2-Cs had a single 120VAC primary transformer.

Effective with s/n 1000, that was changed to a dual primary transformer
that could be connected for either 120 or 240 VAC.

235. Loss of S meter levels?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-01-29 01:05:53 UTC
From: K5VSE
Topic: 235 Message: 235

Hey Garey,

Got any idea what would cause my R-4C to drop the S meter readings. Normally my noise level will run about S-7/8. At times it drops to S-3/4. The signals also drop about the same amount. Now, the strange part, is the sensitivity does not seem to change. I can turn on the calibrator and get 20+ readings. I thought it might be the relay in the transmitter, and I have three new ones, so on two occasions have swapped them and the same symptoms appear. Also when I turn on the T-4XC it will turn off the receiver. I can hit the transmitter and all is well for the rest of the time I am using it. I've cleaned all the switches, controls, etc. and the same thing. Re-soldered numerous connections and still get the problem. May be all are tied to the same thing, but now I'm not sure whether I have a receiver or transmitter problem. Any ideas floating around in your mind?

Thanks

Martin -

The tone is "keyed" by CR15. CR15 is either forward biased to "short circuit" the audio tone to ground, or reverse biased to allow the tone to pass to V9b, by DC bias.

Try paralleling another capacitor across C107. When this capacitor dries out, the ESR goes up and the AF tone from V9a is coupled via the B+ line over to V9b, effectively bypassing the control of CR15.

Let me know!

Subject: [dx-list] Coming soon to a radio near you....BS7

After 3 years of hard work it gives me great pride to post this to the reflector:

Announcing the 2007 DXpedition to Huang Yan Dao

Better Known as....Scarborough Reef

After three years of effort to obtain permission to land and operate from the most needed entity in the world, that needed authorization has been received. A multi-national team led by W6RGG will operate from Scarborough Reef for ten days in late April 2007. BA1HAM and BV4FH have been instrumental in bringing this operation to reality with ongoing support being provided by N4XP, N1DG, K5YY and N6MZ.

A team is being assembled that will include members from Asia, Europe and the USA.

As with any DXpedition to a location such as this, transportation is very costly and will be the largest single expense. Success will depend on the contributions of the DX Community.

Please QRX for more information as it becomes available and the web site is activated.

N4XP for the 2007 DXPedition to Huang Yan Dao.

More to come......but we've already updated the online log and the first qsls are already in the mail so don't ask.

Wanted, Your Boatanchor on air.

After a conversation on 40m one evening, the idea was mooted by a few blokes after a few "Gassy 807's", that once a week operators with Valve Radios or Hybrid Valve radios meet for a general "Rag-Chew" on 40m. The frequency of 7.087Mhz + or ☐ QRM was suggested with a calling time 0900Z on Tuesday evenings with the idea of forming an Australian Boatanchor group. If the interest is there this can be a bit of fun, with the empyesis of keeping valve equipment running and on the air. So pull your old Yaesu' s, Kenwoods, Swan's, Drake's, Heathkit's, Collins', Hallicrafters, Hammarlunds and Homebrew's out of the cupboard and fire em up, remember Keep em glowin!! Contact me if you have any queries Frank Woolfe VK5MFW, frankwoolfe@...

that sounds like a pretty good Idea, and maybe even fun!
I have added a folder under the "Files" section of the groups home page titled "Nets"
and I took the liberty to list this on there. If any others in the group know of related nets
or trying to start one, we can post the information there for the rest of the group as well as
with posting it e-mail. If your not sure how to do that or have trouble with anything else on
the groups homepage, please let me know, I'll be glad to help
Also, if a posted net should become inactive, or if you find a bad link or file, please let me
know so that I might correct it.
Also, I do a lot of PSK31 using a newer radio, however a few days ago I had a QSO with a gentleman
who was using a TR-7, and it worked very well! I did notice a slight change in freq each time he keyed up,
but it was very slight, barely noticable, and once he keyed-up, it didn't drift.
I really like the TR-7 myself, however I really didn't think it would perform that well on such a narrow-bandwith
digital mode.
These really are great radios !

Thanks,
Don

Subject: [DrakeRadio] Wanted, Your Boatanchor on air.

Wanted, Your Boatanchor on air.

After a conversation on 40m one evening, the idea was mooted by a few
blokes after a few "Gassy 807's", that once a week operators with Valve
Radios or Hybrid Valve radios meet for a general "Rag-Chew" on 40m. The
frequency of 7.087Mhz + or - QRM was suggested with a calling time
0900Z on Tuesday evenings with the idea of forming an Australian
Boatanchor group. If the interest is there this can be a bit of fun,
with the empyesis of keeping valve equipment running and on the air. So
pull your old Yaesu' s, Kenwoods, Swan's, Drake's, Heathkit's,
Collins', Hallicrafters, Hammarlunds and Homebrew's out of the cupboard
and fire em up, remember Keep em glowin!! Contact me if you have any
queries Frank Woolfe VK5MFW, frankwoolfe@...

243. Tuning up the Drake L4B Amp

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-02-13 21:00:23 UTC
From: astroham2003
Topic: 243 Message: 243

I really have never used an amp. Ran barefoot much of the 40 years dxing. I am somewhat confused by the manual when it states when tuning for ssb that "turn on the exciter and increase the exciter output while not exceeding .400 Amperes plate current". So far so good ok? Now it then states "while increasing the exciter power, maintain 220mA of grid current with the LOAD control until 0.565 plate Amperes is reached". This is where I don't get it. How do I use the exciter power to maintain
the grid current with the load control? This doesn't make sense.

Now I will state how I have been tuning the amp and please let me know if I am doing it correctly.

Using the exciter I put .400mA of plate amps and then tune the plate and load controls for maximum output using my external wattmeter as the output meter. I then add more exciter power to bring my grid current up to and no more than 225mA and then once again tune the plate and load controls for maximum output. I then throw the red button on the bottom right hand corner of the amp from the cw/tune position to ssb and off I go with a ssb qso. Is this the correct way of doing this?

Thanks for taking the time to reply.

Sorry no answers yet John, I have never ran an amp of any brand, so I wouldn't know on this one,
we are still a small group here, and many follks get this in a "digest" format. So sometimes it can take
2 or 3 days before you see a response.
I would also check through some of the links, as there might be some info on one of those websites as well.

Topic: 243 Message: 246

John -

The correct method is outlined in the manual.

Turn the exciter output power to minimum.

Amp meter switch on Grid current position, power switch to CW.

Key the transmitter and amp.

Increase transmitter output until plate meter reads upscale, then dip Plate control on Amp for minimum plate current.

Increase transmitter output while watching Grid current. When Grid current gets to 150 mA or so, increase Load control on amp which will increase plate current and reduce Grid current, then redip Plate control.

Continue until Plate current reaches 0.565 mA when dipped and Grid current is 220 mA.

Should take about 65W of drive power to achieve this. Then switch to SSB and talk.

Much easier to do than describe. Most critical is to keep grid current at or slightly under 220 mA. For a given drive power, dipping the Plate control will cause Grid current to increase and increasing the Load control will cause the Grid current to decrease.

The amp will just about make the legal limit when driven with a typical 100W driver, so tuning for maximum output, which will occur with more than 0.565 mA of Plate current won't hurt anything. AS LONG AS YOU KEEP THE FINAL LOADED GRID CURRENT AT OR BELOW 220 mA. Regardless of tune-up method, as long as you keep the Plate current dipped (resonant) and the Grid current at or below 220 mA when done.

Easiest is to rectify the filament voltage. Most 12V fans run fine on
the approx 9V DC result. You don't need a LOT of air, just a gentle
breeze to blow heated air away from the PA cage.

254. Microphone levels for B-line?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-02-23 20:41:21 UTC
From: Dave
Topic: 254 Message: 254

I'm putting together a little audio switchbox for some guys I do contesting with. We need to be able to switch mics and rigs. A B-line is a part of the setup. I used to own one, and still have the EV638 mic I used with it, although a desk mic isn't too handy for contesting.

What I need to be able to do is place a switch on my switchbox that resets the output voltage and impedance level to drive either the B-line or the solid state rig that is our other contest radio. The solid state rig only needs 5-10mV microphone level, and the B-line much more. But...has anybody measured the actual mic peak voltage level that the B-line needs? This old crystal microphone delivers about 1.5V peak (3V peak-to-peak) and I think I was able to run my T-4XB with the mic gain about 12:00 o'clock...so is that a good target level?

Thanks,

Dave W8NF

Dave -

Problem is that the B-Line expects a "high" voltage into a high impedance (100k+), and the SS rig expects a lower voltage into a low impedance (600 ohms). You can drive the B-Line with a low-Z source, but need the much higher voltage (3V p-p) to drive it adequately.

You might look up the Astatic D-104 microphone with Google and find a description of the base mounted preamp. There are also articles for a FET preamp on the internet.

Hi Garey,

Interesting things come up when you Google D-104 preamp. There's a common claim out there that the purpose of the preamp was to equalize inferior crystal elements, when Astatic started purchasing them instead of making them.

Is 100kohms the right value? I was thinking that one megohm would be about right.

Well, I can measure the EV microphone I have and use that as a guide, I suppose.

Thank!

Dave W8NF

Dave -

I think 500k to 1M is correct. The actual load resistance affects the response curve of the microphone. I believe one of the D-104 sites has some curves for various load Z's.

My understanding was that the advent of solid-state transmitters with their low-Z microphone inputs was at least part of the reason for the addition of the preamp. It also guaranteed the SAME response regardless of the load impedance, since the amplifier input Z could be tailored to get the desired response and the output was very low-Z and essentially unaffected by load Z.

There are some who believe that it was just a way to impress the CB market by allowing them to kick the wattmeter higher, who cares about distortion!

Personally, I'll stick with the first two ideas above.... I guess you have to adapt to make a product that spans a 70 year market life!!

a very versatile mic! and Astatic has only stop producing them here
a couple of years ago.
My first D-104 was actually on a Demco super satelite 23 channel all
tube cb. and was without
the preamp, the cb had its on preamp and early version of a speech
processor they called a "modulator"
this was back when cb's required a license and wasn't at all like it
is today.
I used one both with and without the preamp on a TR7, worked well
enough. At least, no one complained.

Topic: 261 Message: 261

In CW mode my T4X is hanging up lately! I can't get it to retrun to standby with out turning it off then back on again? VOX delay has no effect and VOX sensitivity and gain controls are acting weird?

There's actually a combinations of setting on the VOX Sens &Gain controls where if I send a DIT it trips the relay then hangs until I send a DAH then it releases and goes into standb? Huh?

I've replaced the 6EV7 and swapped the 12AX7s? any suggestions?
TKS Steve

Steve -

First, check the bias supply to make sure it's at ~ -60VDC with NO ripple.

Check R94 and R95.

Possibly leaky C143.

My T-4XB did the same thing. The VOX circuitry is extremely high impedance and it's amazing how much damage a little dirt can do. After replacing the tube did not help, I cleaned the tube pins, the chassis and connector around the CW key input, the VOX delay and sensitivity pots, and used alcohol and a toothbrush on the insulation on the top and bottom side of the tube socket. This cleared up my rig's symptoms.

Hope yours is this easy.

Thats a new one on me. 73, Garey - K4OAH is the resident expert
on these tube Drakes
BTW, Garey I would like to thank you so very much for your
contributions here, and on other list,
your knowledge and experience with these radios is awesome !!
I think I speak for anyone who has been around Drakes for
awhile, I hope it is a long , long time
before you leave us ! would you do me a personnal favor? would you
post your bio and tell us about yourself here?
just like the radio's you support, your own legacy should be recorded
somewhere.
for the list: Garey has been very active on here and other
reflectors, and is THE "go to" guy on these radios !
I may be wrong, but I believe I read where Garey also does repair
work for those who need it. really supports the
radio by freely helping so many other Hams, so its not just a
commercial interest.
I myself have only used the TR-7 line, however, I am seriously
condsidering moving into the tube models, probably
starting out with the 2 line. any general advice on this ?
I'm not bad with the 7 line, as I am much more comfortable with
working on solid state devices, and the 7-line is
a really well designed, straight forward radio.

Don Frasher
KE7FFM
Idaho

PS. Recently I had a QSO with a gentleman on PSK31 who was using a
TR-7 very stable, amazing ! still competitive with today's radio!

Drakers,
I'm looking for a source for two oscillator crystals for my Drake 2A.
One is 11.0mhz (40m) and the other is 18.0mhz (20m).
Anyone have a lead, let me know.
Thanks
Barry

Barry -

International Crystal Manufacturing (www.icmfg.com) offers high quality crystals.

Some have used a "standard" $1 computer crystal at 18.0 MHz, which works fine if you don't have to have absolute frequency accuracy.

You might also try replacing the 6U8 oscillator tube with a 6EA8. This tube, with it's higher gain, will often "fix" sluggish crystals in the 2-B.

ello
recently i' ve got a TR4C and a RV4C.
I have some problem with the TR4C.

The TR4C lack of sensibility. I have the volume turn full cw and i have difficulty to heard station.
When i plug the RV4C, turn the RV4C knob to rcv or rcv/xmt volume/sensibility is OK ?????
When i put the RV4C knob to OFF or XMT problem come back.
When i unplug the RV4C problem is there in the TR4C.

Any idea ?

Doug,

That is due to the design of the rig. The easiest way to understand how the TR-4 frequency and sidebands are set up is to do a calculation of each band. The 80 meter band is the 9 MHz carrier minus the PTO 5 to 5.5 MHz. 20 meters is 9 plus 5 to 5.5. The other bands have a band oscillator involved too. 40 meters is 21.5 MHz minus PTO then mixed again minus 9.0 carrier to get 7.0. Name the filters above and below and do the calcs and you will see that the sidebands flip around depending on the band and the desired mode USB or LSB. Drake put in a set of rotary contacts on the band switch to operate the lights telling you which sideband you are on depending on the sideband switch setting.

I would think your TR-4 is fine.

Hello Larry
i found the problem.:Bad soldering joint at R100.
Now there's only one problem left it is a big hum.
I found C4 defective in the PS.
Now the TR4C and the RV4C end the PS4 works very well.
Just S meter to adjust.
Sop Tnx and best 73 Larry.

276. L-4B Question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-03-10 05:21:56 UTC
From: George- K4GM
Topic: 276 Message: 276

I recently obtained an L-4B which appears to be in virtually mint condition. It works fine but would like comments as to whether I am getting all the power I should expect or whether my tubes might be going soft. I have a pair of Eimac 3-500z tubes. Following the recommended tuning procedure I obtain an input of 1140 watts (1900 volts @ 600 ma with a grid current of 225 ma). Output is about 650-700 watts. For this input the output seems about right to me. I had hoped though with those two tubes that I could get a full kw out. Now if I switch to the SSB position I can get a full KW out on cw. Is there any reason not to run cw in the SSB position?? Finally, is this amp rated at 100 percent duty cycle for RTTY; i.e., may I tune it up in cw for 700 watts out, switch to RTTY and go?

Thanks in advance to all who respond,

George K4GM

Unique supplemental service information CDs available for the Drake B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

George -

Short answer, sure you can!

Correct answer, not a good idea.....

The L-4B was designed when the PEP _INPUT_ limit for amateur radio was 2KW, derived from a 1KW "single-tone" (CW) carrier. The cooling system for the L-4B was designed to be adequate for _specified_ operation as a trade-off against blower noise.

The real question is, WHY? Yes, you can push the 3-500Zs, their cooling system and the power supply for a 1 KW CW output, actually you can get about 1400W output. The question though is WHY would you want to push the system past it's design goals for approximately _ONE-HALF_ of an S-Unit at the receive end?? If you only go to 1KW output, you're gaining less than one quarter of an S-Unit!!

Also, yes you can run 1 KW RTTY with the L-4B. I would suggest adding a fan on top of the power supply AND a fan blowing air across the top of the RF cabinet itself. Again, the question is ... WHY? So you can put "1KW output here" in your brag tape?? (Excuse me, brag "function key")! :-)

After all, a pair of 3-500Zs will only run you about $3-400 for Chinese made copies. Or, you can run them at the design parameters and the Eimac's will last the rest of your life.....

I was aware of the S unit considerations you mentioned. I just wanted to know to what specs the L-4B had been designed. I've been using it at 700w output where it runs amazingly cool. That is about as high as I want to go now that I know the L-4B design goals. BTW I've been around ham radio since before Drake ever sold an L--4B.... the 2-B was THE receiver when I started. None of my friends back then could concede that such a fine receiver could be built into such a light weight package.

Thanks to all who answered.

The question though is WHY would you want to push the system past it's design goals for approximately _ONE-HALF_ of an S-Unit at the receive end?? If you only go to 1KW output, you're gaining less than one quarter of an S-Unit!!

Also, yes you can run 1 KW RTTY with the L-4B. I would suggest adding a fan on top of the power supply AND a fan blowing air across the top of the RF cabinet itself. Again, the question is ... WHY? So you can put "1KW output here" in your brag tape?? (Excuse me, brag "function key")! :-)

After all, a pair of 3-500Zs will only run you about $3-400 for Chinese made copies. Or, you can run them at the design parameters and the Eimac's will last the rest of your life.....

OK, cool. (So to speak!) Well you'd be surprised how many DON'T
understand the S-Meter considerations! :-)

The 1-A "mailbox" receiver was the first to dispel the "under 50 pounds
= unstable" myth. Wish I still had mine! We demonstrated the 2-B by
tuning in a CW signal, and then lifting the front edge of the receiver
off the counter a couple of inches and dropping it! It would "boing"
slightly, if at all, and return exactly where it was. The guy would
reach over to turn the main tuning to make sure we were listening to
THAT receiver.... Keep in mind this is in the day when you couldn't
walk across the floor in the same room with a Hallicrafter's 50 pounder
without it "boinging" up the band.

Topic: 286 Message: 286

Hello
i have some mystic problem with my TR7 ???
I use it with my L4B on 80 meters and i cant load my L4B very well.
Maximum watts output +-300

I load the L4B with TR4C and it have abt 600 watts ???

I changed the coax between the TR7 and the L4B and it is the same ?

Without L4B the TR7 have 140 watts on MN2000 ?

any idea
Tnx

There may be an impedance mismatch on 80 meter tuned input coil for the L4B ... I believe they are adjustable..The TR-4 uses 3 6JB6's and therefore has more output than the TR-7 so that would also explain the differences in output....also there is sometimes differences in impedances particularly in the solid state radios...just a guess of course.

Martin -

The L-4B should only require about 60-70W of drive for full output.

What does the TR-7 power meter read when you are driving the L-4B?

If the TR-7 power reading is low when driving the L-4B. most likely the Input matching adjustment on the L-4B is mis-tuned. If you insert an SWR meter between the TR-7 and the L-4B, you will probably see a high reflected component on 80M. This high SWR is causing the TR-7 to fold back it's output power to protect the TR-7 finals.

If you DO see a high SWR between the units, you need to perform the Input Coil Adjustment procedure in the L-4B manual, Section 5-14. The adjustment is very broad, and will cover the entire 80M band - IF - it is set correctly. Normal setting is with the adjustment near the top of it's travel. If your 80M adjustment is not near the top, you can try just setting it there without going through the entire procedure to see if that reduces the SWR enough.

IF you are not able to adjust it, you may have a failed capacitor at C5, C11, C16 or C21.

290. TR-4C: 10 Meter Problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-03-24 21:44:27 UTC
From: Ron DiProfio
Topic: 290 Message: 290

Hello Drake Group,

I have recently bought a TR-4C from an old friend. I'm hoping to put this transceiver into service again. The radio generally operates well but I noticed that the 28.0 and 29.1 band positions don't seem to work (receive). I have also noticed that there are some crystals missing, located behind the meter. From the legend on the chassis, it looks like the missing crystals are 43.6 and 42.5. Is this the reason some of the 10 meter band segments don't work? Are these crystals easily obtainable?

I'm new to this group so I hope this question is appropriate.

Ron -

That is "normal" for the TR-4C.

Those two crystals were not included when the transceiver was new. They WERE included in the TR-3 and 4, but as a cost-cutting move were left out of the "C". In fairness to Drake, the TR-3/4 was intended for mobile SSB, which at the time meant 28.5 - 28.7 MHz or so. The later version TR-4CW and TR-4CwRIT DID have the crystals included again.

The crystals are available, either new from several manufacturers, - or - from a junker TR-3 or TR-4.

Ron,

Those are the optional crystals for 10 Meters and you cam order them from Jan Crystals. If you do so it will take about three weeks to receive them. Good luck with your TR4C.

The XMTR Gain control is set at full counter clock wise and if I start to turn it up it keys the radio with no mic connected. Also If the mic is connected the mic keys radio with no audio. I checked the mic amp tube and it seemd to be ok. Also the S-meter shows around 9 s units with the gain set at maximum. Any suggestions would be great. I got this unit with the RV4 and finally got the receiver working and calibrated somewhat. Need help with the transmitter now.

Have you verified the bias supply voltage? Should be about -60 to -65
in the transceiver.

Can you set the Final idle current to 100 mA?

I will try a few more adjustments sometime this week. I will check the bias setting also to make sure its .1 on the PA meter. I need to check the correct operating proceedures also to make sure I have it set correctly for SSB or AM transmit. I have a guess that the Carrier Balance is wacked out or something to that extent. I see 0% audio and need to check the MIC AMP circuit also. Just seems odd that the S meter acts funny. 1 other question. There is a smaller relay under the rear of the transeiver on the right. I need to look back through the schematic and see what it does. Maybe a keyer relay for CW since the main T/R relay is in the finals cage. I have a complete C Line I run and maybe just need to get more familiar with the TR4/RV4 VFO set up. RUNS VERY HOT AT IDLE. Needs a fan. Thanks neighbor.

Bobby -

The relay back near the Car Osc is the CW shift. It switches in a capacitor to move the Car Osc up a kHz to put it into the filter passband. The same function is handled by a diode switch in the T-4X.

There's a LOT of tubes in there! A fan is a good idea on a T-4X, even more on the TR-4!!

Of course, if the PA bias is running high, you get a LOT of extra heat. It's a good idea to confirm that the Plate meter is reading accurately at 0.1A with a separate meter also. The meter shunt is a one ohm resistor, and has been known to change value and make the Plate meter read high OR low.....

What's the serial number of your unit? I'm working on a CD for the TR-4 series, and so far have come up with eleven (11) versions of the schematic for the TR-4/C. It helps to have the correct schematic when you're trying to figure out what's going on!!

The serial is #29176. I am guessing the date for it is around late 68 to early 1969. There is as odd thing about the vfo but I am not 100% sure what it is. I finally got the transmit audio working on SSB and alligned it for AM also via carrier osc adjustment. Someone got into the TR4 at some point and had no clue to what they were doing. I fined tuned the receiver IF and it brought up all signals. Seems to do well with the 3 6JB6's that came with the unit. Around 180w or so on 80 meters. As usual lower output on 10 meters and lower receive. I did adjust the bias to .1 plate amps. Should I go down to .007? like the C-line says to in that bias adjustment? It says intially set to .1 plate amps then back it down just a little more. The TR4 was up and operational tonight and received good reports with the Shure 444 mic. I need another one now since I borrowed it off my C-line. Ebay mic hunting I go.

ps: S-meter was a quick fix with a IF Amp tube (12ba6) and it now zeros correctly. I need a OA2 tube for the matching RV4. It blows the bulb in it ever time I turn on the VFO.

Bobby -

OK. The correct schematic is 28500. Date for 29k would be late 69.

Drake later refined the T-4X idle current up to 0.1A to improve the distortion spec. The TR-4 current probably should also be increased accordingly, but I've never seen a revision from Drake.

The S-Meter bridge compares the plate current of the two IF stages with the plate current of the AF output. S-Meter problems are usually the result of a weak or gassy IF tube.

What color are the two crystal filters in your unit?

This is from Yahooey!

Duplicate Messages and Email Delivery
We're aware of the duplicate message bug that has been affecting groups today and are working to resolve the issue (a side effect of this bug is that some messages are also being delayed). We have actually pushed two fixes already, but we are aware that some groups are still experiencing the
problem and that more needs to be done to fully resolve the issue.

There is, however, one silver lining to this bug. It was the result of our latest system updates intended to improve email delivery speeds. So once the
bugs are resolved, we should see a significant reduction in the time it takes to deliver messages to Yahoo! Groups members.

We will update this blog entry as soon as we have more definitive information on the status of this issue.

Thank you and our apologies for any inconvenience caused by the duplicate messages.

The Yahoo! Groups Team

Ok the crystal units in the one TR4 are blue in color. I would give you the name but I don't feel like pulling it back apart but if needed let me know for the names on the crystals. Thats the serial number I gave you before. The crystal color of the the parts TR4 are grey in color. The serial number on it is #23610 and are what appears to be Bedford Co. 9m crystals and have a metal unpainted finish. If you need parts let me know.

304. Switchcraft 0.206 inch microphone plug FS

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-03-31 17:08:53 UTC
From: Ken Simpson, W8EK
Topic: 304 Message: 304

For Sale:

I found a Switchcraft 0.206 inch, 3 conductor plug.
This is the original Switchcraft that was used on many of the
Drake transmitters as the microphone plug. It is the right angle
type, just like what was on the mics from Drake, as best I can tell.

This one has screw terminals, and appears that it is unused,
although with screw terminals it is hard to tell for sure. I suppose
it is possible that I used it once, many years ago, but it does not
look like it.

$10 plus shipping from Florida.

Thanks.

316. Advice for a new Tower

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-04-30 00:44:12 UTC
From: Don
Topic: 316 Message: 316

While it's still a little bit up in the air, I very well may have some money
soon to put towards a new, and first, tower. :)
I really do not see myself having the funds to replace or update it for a very, very,
long time. So I really would like to get the best, most durable, safe, etc tower that I
can.
looking to go 50 foot, my small lot makes me uncomfortable with going any taller. Should
there be a problem and the tower fall 50' will allow it to clear the neighbors with plenty
of
room to spare.
Also, we often see 50+ mph winds wiht gust at 70+ , I am sure it can get worse than that,
I just haven't seen it since i have lived here in Idaho.
No, I haven't settled on the beam to put on it yet, though eventually I would like it
to have a 14-30mhz LogP or such. this will also be a support for my low band dipoles, 2mtr,
atv, ect.
I have been looking very hard at AN towers, but I would welcome any comments on any of the
currently available towers, free standing is ok, but not necessary, not sure that I really
trust a
free standing tower with the winds we get here. and I dont think the alum towers i have
seen
so far are really as stout has I would want, and still too expensive for them.
Last, I would hope to keep total cost at or below $3,500. there is some flex to that
figure,
just my goal. if i can keep the cost down enough maybe i get a palstar or o ahead and look
the antenna purchase as well.

Thanks in advance,
Don

317. Drake TR-4Cw Crystals

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-04-30 02:02:08 UTC
From: Peter
Topic: 317 Message: 317

Hi all, new to list & hobby. After passing my test a buddy gave me a Drake TR-4Cw. I bought a reprint manual and have stared at the radio a bit. My question is about the crystals and selection. Inside the transceiver are 6 crystals. One is centrally located in the radio chassis and is about twice the height of the others. It is an NEL 11/76 NE-13E 100mhz. The other 5 are located in a row behind the face plate of the unit all together in a row. Working from left to right from the operators perspective I have; Erie 21.5 mhz 6/76, Erie 35.5 mhz 6/76, Tedford 42.5 mhz T/R 4C 2-77, Erie 43.0 mhz 10/76, Tedford 43.6 mhz T/R 4C 2-77. I assume the 2-77 and 10/76 etc numbers on each are the date of mfg. The radio is a 1976 model.

How do the crystals effect the ranges of frequencies? A simple explanation would probably be best for me as I am new at this. What crstals do I want? I have read that some Drake radios can receive WARC bands. Is this possible through the crystals or some other methods. Any crystal info appreciated. 73 & thanks, Peter KC2RBX

Peter,

The real tall crystal is for the calibration marker. You will here it at every 100 KHZ on the VFO dial. The other five crystals are for the bands, 80 M; 40 M; 20 M; 15 M and the three 500 KHZ segment of 10 M. Look at your manual and it should tell you how to set up for the band you want to transmit on. If you have any other questions please post them. Welcome to the group!!

If you need help with your TR-4CW you can contact me off line.

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-04-30 05:37:16 UTC
From: Larry Taft
Topic: 317 Message: 319

Actually there are crystals in the front row for 40, 15 and the three
segments of 10 meters. The TR-4s use a 9 Mhz IF frequency and the VFO
covers 4.9 to 5.5 MHz. The VFO is subtracted from the 9 MHZ IF to get
80 meters and the VFO is added to the IF to get 20 meters. Notice that
20 meters tunes the reverse of the other bands because of the addition
process. For the other bands there is an additional mixer circuit using
the crystals in the front row. For 40 the xtal is 21.4 Mhz.
The VFO is subtracted to give a intermediate frequency in the 16 MHz
range and then the 9 MHz IF is subtracted to give the 7.0 Mhz range.

Similar numbers work for the 15 and 10 meter bands.

Tuning the WARC bands would require major surgery on the TR-4 series.

The R-4/T-4 Twins series can tune the WARC bands with additional
crystals as the IF is 5645 Mhz, every band requires a crystal and the
VFO tunes in the same direction for all bands.

Good radio, you'll have a lot of fun with it.

320. FS: Drake 2B Receiver

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-05-01 18:56:24 UTC
From: J. Morris Prosser
Topic: 320 Message: 320

For sale is a Drake 2B receiver, serial No. 4655. Working on all the normal bands, including
all 3 10M segments. Crystals installed are 11.0, 11.5, 18.0, 24.5, 25.0, and 25.6. All tubes
have been tested. Appearance is good, with a little wear showing around the edges of the cabinet and some of the usual dirty coating on the chassis, no rust. Manual and 2 CD-ROM's included. Photos available on request. Asking $120 plus shipping from Medford, OR 97504. Not packed yet, but estimate about 20 lbs.

Thanks for looking,

Morris

330. AGC problem with R-4C

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-05-10 20:28:24 UTC
From: Mike-K5VSE
Topic: 330 Message: 330

Hello to all the Drake experts out here.

I have a strange problem with one of my R-4C receivers. The AGC works just fine in the slow position. But if I move it to medium or fast, it progressivly gets more distorted. The audio is normal in the slow position on all modes, but there is no way to copy at all in the fast position. It's sounds like it might be motor boating, for you old timers that remember that far back. And yes, I fit that catagory well!

Has anyone come across this problem in the past? If so, I would appreciate your input as to where to begin looking for it. I have checked/replaced tubes, checked voltages etc.. Everything seems to be within 10% or so.

Thanks in advance for any responses.

73,
Mike/K5VSE

339. WTB anode connectors, original for Drake L-4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-05-26 00:05:58 UTC
From: Mike-K5VSE
Topic: 339 Message: 339

Hi to all on the list!

This will probably be like hunting hens teeth, but I am in need of two original anode connectors/heat sinks for the 3-500Z tubes in an old Drake L-4B. These are the ones with the vertical fins, "NOT" the horizontal type. I purchased the amp with no tubes, connectors, or chimneys. I was able to get the tapered chimneys from Ameritron, but the only type anode connectors I was able to locate have the horizontal fins that Eimac used for many years. Drake uses some with vertical fins, and I am trying to make this thing as original as I can. So, I am only interested in the original Drake production type that came with the amp.
Any help will be greatly appreciated.

Thanks to all!

Mike/K5VSE

Speaking of L4's. I think I have the oldest L4 in existence. It is serial #003. But who knows, #1 and #2 may still be out there. I have had this L4 for over 20 years and it has the Eimac type anode caps. Doubt they were ever changed. I mean, why would you? So did Drake use both kinds? I think this one belonged to QRP Mikey. So who knows. Some of you know who QRP Mikey is, I am sure. John Page K4KWM

whats everyones FD plans this year?
with or without a Drake.
I understand not wanting to risk one with the hazards
of field operation.
I'll be using a ts-440, and setup at Lake Walcott
here in south-central Idaho.
will be doind some psk31 and maybe cw. mostly ssb
no amps, wire dipoles. and I am hoping that I will be able to go the
full 24hr.
we are a small club here, so while there will be others come by, but
so far only one other ham is really doing much to gear up and support
it here. xyl's will be with us which is always nice !

Unique supplemental service information CDs available for the Drake B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Fellow enthusiasts,

You are cordially invited to check into the Drake and Antique Tube Gear Net, Tuesday evenings, 8 pm Eastern time, on 3865.

Also, please join the Drake Technical Net, Sundays, 7238 +/-, at 2000 Zulu, or 4 pm Eastern time this season of the year.

73,

Evan, K9SQG

Ted -

According to Bill Frost, this never existed. There might have been something that an individual tech put together, but nothing was ever "official".

Unless someone has been "fixing" it, the procedure in the manual is all you need. If it's really been screwed up, (as in someone "tightening up all the loose screws" in those pesky trimmer caps and cans,) all you need to do is ensure that you are peaking on the "right" peak if there's more than one.

Are you having a specific problem?

Group,
Good day, first time to post here, but for a reason.....
I am helping a fellow ham trouble shoot his 4C and have found the 13v missing.
Does anyone know the physical location for the zener CR1 and cap C191?
These are fed off of the R7 20 watt dropping resistor that seems to connect via the t/r board to parts unknown.
A conversation with Bill Frost at Drake wasn't a great help.

364. New to this forum

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-07-20 17:42:08 UTC
From: kc8okg
Topic: 364 Message: 364

Hello and thanks for reading my post. I hope this is the correct location for this post. Thanks for letting me join. My name is Greg Sarris and this is my first experience with this forum as well as drake equipment. I am also fairly new to tube rigs as well.
I recently picked up a t4xc in very nice shape it seems fairly late serial number.(289??) The R4c is still on its way here.
I have a few questions that im sure someone can answer here.
1. When I tune the transmitter per the manual--with bias adjustment as called for, I notice the tubes--esp one tube shows cherry red color while transmitting CW. When I adjust the bias for less resting current, the tubes seem to be much cooler and output seems unaffected on CW of course. Forgive me for my ignorance, but is it okay to transmit CW with hardly any resting current on the tubes??? I am also aware that this would have to be increased to operate SSB. I understand these 6jb6 tubes are only rated for 17w dissipation, so im trying to not exceed that of course.
2. I adjusted the trimmer that controls neutralization so that plate current dip corresponds to maximum output. Before adjustment that wasnt the case. So I assume that it is neutralized?? Here is something else- On the higher bands, 20,15,10, it seems that there are (two) places that the plate current shows a dip. I have been told that that is a sign of poor neutralization?
However, on those higher bands, plate dip still corresponds to maximum power out.
Lastly, the tubes show more color when drive is lower. In other words, the transmitter seems to run cooler when output is 100+ versus 30 or 40 watts out. Seems strange to me. Im sure either I am doing something horribly wrong, or something is messed up.
Otherwise, the unit puts out full power, about 100 watts at 300 mils and more power if pushed more, however, I dont see the need for any more than 100w.
Again, forgive me for my ignorance, any suggestions or information would be greatly appreciated. Thanks in advance.

First, the tubes should NOT show any color when running resting current. Generally speaking, when one tube shows color, it indicates that the OTHER tube is not carrying it's share of the load. Matched pairs of finals are not required, but are recommended for minimum distortion. The difference between statically or even dynamically matched finals is real, but a pair of NEW tubes of the same brand are "close enough".

The bias adjustment should be to 0.1A. Ohm's Opinion tells us that this is 65W of plate dissipation in two tubes that are rated at 16.5W each. There are a couple of factors that mitigate this seeming problem. One is that the 16.5W rating is for a tube that is running all day, closed up in a cabinet with 20 or so other tubes in a color TV set. Another factor is that this condition is only present between code elements or speech syllables in actual use, plus the VOX delay at the end of each transmission. Fortunately, short term overload is something that vacuum tubes handle very well, unlike their SS cousins. Since the final stage in the Drake transmitters is designed to operate as a LINEAR amplifier, it is NOT a good idea to operate the finals with less resting plate current than Drake recommends. That current sets the operating point of the amplifier, and affects the linearity and therefore the "cleanliness" of the transmitted signal. Certainly more of a problem on SSB than CW, but insufficient bias can result in spurious transmitted signals in CW, such as key clicks and other distortion products.

>
Secondary plate current dips indicate improper neutralization. Here again, mismatched (different brands) of final tubes can cause neutralization problems. Some brands of 6JB6s are difficult or impossible to neutralize without modification to the transmitter, and mixed brands of finals are just asking for headaches! Aside from that, I find it easier to first perform the neutralization test on 15 or even 20 meters, where the adjustment is a little broader and easier to find. Then switch to 10M and refine the adjustment, which should take only a very small (if any) touch up.

>

A far better procedure is to tune the transmitter for maximum power output in the TUNE position. This adjusts the final for a proper match to the antenna and best efficiency and linearity. Then if you want to run less power, reduce the GAIN control for the power you desire. If you are running reduced power to save electricity or for some desired QRP reason, that's fine. But other than that, the Drake transmitters will run full power for as long as you want them to in CW or SSB. The KEY to long final tube life is to ALWAYS ensure that the amplifier is tuned for minimum plate current as quickly as possible. The very feature that made TV sweep tubes desirable as final amplifiers, (their ability to draw very high plate currents at relatively low plate voltages,) is what will kill them quicker than a lower perveance tube such as a 6146 or 807. IF you tune them up properly, keep them neutralized and don't operate the transmitter into the wrong antenna (!) 6JB6s will last for many years. I have "well used" T-4X and TR-4 transmitters with 6JB6s that have been running for over 10 years. The other thing that will greatly extend final tube life is a small fan on the top or back of the final plate cage, blowing air _OUT_ or _UP_ . It doesn't have to be a big fan or sound like a B-29, just a silent, gentle flow of air to move heated air away from the final.

Greg,

If you are running the T-4XC transmitter the bias for the TWO 6JB6's is 0.065 ma and not 0.1 A. The TR-4 line of transmitters has three (3) 6JB6's and their bias current is 0.1 A.

I hope this helps you.

Secondary plate current dips indicate improper neutralization. Here again, mismatched (different brands) of final tubes can cause neutralization problems. Some brands of 6JB6s are difficult or impossible to neutralize without modification to the transmitter, and mixed brands of finals are just asking for headaches! Aside from that, I find it easier to first perform the neutralization test on 15 or even 20 meters, where the adjustment is a little broader and easier to find. Then switch to 10M and refine the adjustment, which should take only a very small (if any) touch up.

> Lastly, the tubes show more color when drive is lower. In other

> more than 100w.
>

A far better procedure is to tune the transmitter for maximum power output in the TUNE position. This adjusts the final for a proper match to the antenna and best efficiency and linearity. Then if you want to run less power, reduce the GAIN control for the power you desire. If you are running reduced power to save electricity or for some desired QRP reason, that's fine. But other than that, the Drake transmitters will run full power for as long as you want them to in CW or SSB. The KEY to long final tube life is to ALWAYS ensure that the amplifier is tuned for minimum plate current as quickly as possible. The very feature that made TV sweep tubes desirable as final amplifiers, (their ability to draw very high plate currents at relatively low plate voltages,) is what will kill them quicker than a lower perveance tube such as a 6146 or 807. IF you tune them up properly, keep them neutralized and don't operate the transmitter into the wrong antenna (!)

6JB6s will last for many years. I have "well used" T-4X and TR-4 transmitters with 6JB6s that have been running for over 10 years. The other thing that will greatly extend final tube life is a small fan on the top or back of the final plate cage, blowing air _OUT_ or _UP_ . It doesn't have to be a big fan or sound like a B-29, just a silent, gentle flow of air to move heated air away from the final.

Topic: 364 Message: 367

Hello,

What are the differences between the R-4, R-4A, R-4B?

Thank you,

Bruce WA8TNC

Walt -

Well not exactly. The recommended 0.07 A plate current for two, (there is a mark on the T-4X plate meter scale,) and 0.1 for three 6JB6's in the TR-4.

They also recommended limiting plate current to 340 mA on the T-4X and 350 mA on the TR-4. This occurred around the time the distortion and spurious expectations of "best practices" in Part 97.73 came up with the FCC.

The 2-B is an outstanding CW receiver, the dial calibration is a little coarse by today's standards, but for just getting on the air and enjoying a CW QSO it works as well as any. It has three (L-C) filter bandwidths, (500, 2100 and 3600 Hz,) built in along with passband tuning. The 100 kHz crystal calibrator was optional. The companion 2-BQ Q Multiplier adds a very sharp peaking filter and a nice tunable null, both at the IF.

There is no matching transmitter for the 2-B.

The R-4 is almost a 2-B, just with a linear PTO and 1 kHz dial calibration. All tubes. Very similar in operation, and will transceive with the matching T-4X for an excellent CW station. Four filter bandwidths, (400, 1200, 2400 and 4800 Hz,) passband tuning, noise blanker, LC notch and 100 kHz crystal calibrator built in.

The R-4A (early 13 tube model) is an improved R-4, almost identical specifications. PTO and Band Oscillators converted to solid state.

The R-4A (late 11 tube model) almost identical specifications. Product detector, BFO, AGC and low level audio stages converted to solid state. There are a total of four versions of the R-4A.

The R-4B (early) is very similar to the late R-4A, minor modifications and crystal calibrator multivibrator for 25 kHz markers.

The R-4B (late) almost identical except PTO changed from bipolar to FET. There are also four versions of the R-4B.

The R-4C (early) very similar, except IF filters changed to crystal filters. Only the 2.3 kHz filter is standard, 250, 500, 1800, 4000 and 6000 Hz BW are available as options. The 4000 & 6000 Hz filters are normally installed in a special socket under the chassis and is effective on AM only. Four position filter switch. The noise blanker was optional. Entire audio chain solid state, tubes used only from RF

to IF, all other stages and oscillators solid state.

The R-4C (late) same. Five position filter switch. And, sure enough, there are four versions of the R-4C.

The 2-B through the R-4B used L-C filters in the IF. This type of filter has much gentler slopes, which means that nearby signals are still heard, just at reduced levels. The crystal filters are steep sided, more like the crystal filters in today's receivers. Personally, I prefer the L-C filters for all except heavy duty contest use. I like to hear what is going on around my frequency, instead of "listening with blinders on"...

The T-4 series transmitters are all pretty much the same, the T-4X had 4 pole crystal filters while the T-4XB and C had 8 pole filters. The later ones therefore had slightly better carrier and unwanted sideband suppression, neither of which has ANY effect on CW operation. ANY 4 series receiver will transceive with ANY 4 series transmitter, mix and match. There are minor things like the B line had a neon indicator light under the dial to show which PTO was controlling in transceive while the C line just turned the dial lamps on or off. The R-4 and R-4A had neither, so you had to look at the switch!

My opinion..... The R-4B is probably the best receiver overall. It has great audio, smooth AGC, all the filters and noise blanker are built in. The L-C filters are not quite as "drop off the table" selective, but I prefer that for casual QSOs.

The R-4C has poorer audio, a little harsher, the "better" (?) crystal filters are extra, and the noise blanker is extra.

The R-4 and R-4A are just earlier iterations of the R-4B, and are not quite as refined, although some say they prefer the early R-4A to the R-4B because the tube type product detector in the R-4A is "cleaner".

The 2-B isn't very far behind, except it will NOT transceive with anything, and the dial calibration is not precisely linear.

Nice job Garey, I dont think I could add anything to that! Only perhaps if your looking to buy, and I am guessing you are, the R4A (late) model might be the best values...collectors, like me, tend to go for the R4B and others for the R4C line, personally I agree with Garey in all respects, I like the sound of the R4B better, and it was actually quieter than the R4C (2nd version) I owned.

I agree with Garey. I prefer my late R4B (#16015) / T4XB (#20128) twins to my C-Line which has spent most of the last year or so on the shelf.

Check Epay..but prices and time of the year seems to make a difference...anywhere from $150 - $200 for R4A and up for R4B and R4C ....just my experience +/- ...

73, Tim K8WBL

PS> If you buying them separate, that is, the transmitter and receiver, especially the R4/A/B , check the color dots on the xtals...cant remember which is which but Drake color coded the xtals that tended to drift up, drift down, or not drift too much...this is not so much a concern on the C line since Drake added an additional cable line to sinc up with the transmiter...another difference between the C line and others...

Bruce -

Pricing is always a question. Essentially it's what the buyer and seller feel it's worth. Typically prices are a little lower from an individual seller or on a venue such as E-Ham or QTH, with E* being the highest. Pricing tends to follow the size of the potential market for some reason! Although there are always exceptions! An R-4 in decent condition tends to be around $150, the "A" around $200, "B" around $250 and "C" $300 and up. The "C" can be a little misleading, since models through the B are complete, while the C when "stripped down" has only the SSB filter, and no Noise Blanker. Fortunately the E* vultures haven't figured out yet that the C crystal calibrator unplugs, or that would be stripped out and sold in a "separate auction". I expect any day to see each tube being sold in a "separate auction", but so far so good. The filters range from $50-125, depending upon bandwidth and ... The NB-4 Noise Blanker runs $150-175. The condition of the copper plated chassis on all but the C has a considerable effect on the selling price. I have seen them anywhere from pristine to looking like they spent the last year at the bottom of the river. The effect on operation is negligible in _most_ cases, but is really unrepairable. The C has an alodined chassis, and is MUCH tougher, although nowhere near as attractive!!

There is current pricing information on the WB4HFN website

<www.wb4hfn.com>

and there is also an article on the color coding of crystals in 4 Line equipment there. It's difficult to find "matched" sets anymore, but it is _ONLY_ a matter of concern for transceive operation on SSB. The variation is undetectable on CW. Transceive operation up through the B Line depends upon the absolute stability of the Carrier Oscillator crystal in the transmitter and the 2nd Mixer LO crystal in the receiver. A CUMULATIVE variation of even 30-40 Hz between the two is audible on SSB. So late in the A series, Drake began selecting crystals and grouping them into four "grades" that basically "drifted together", putting a paint stripe on the crystal and adding a letter to the end of the serial numbers. The letter is not a guarantee of the color of the crystal, since Drake would exchange a crystal for an owner who ended up with different letters, and more than a few were changed back then. The situation was resolved in the C Line when an extra cable was added to enable a sort of phase lock between the two crystals, keeping them together.

Thanks for all the advise and information.?I have decided to send the unit to a gentleman in TX who works on these so he can look the unit over. I have also sent him my r-4c as well so he can hopefully get both running well.

About the gain and tuning issue. I was tuning for maximum output using the "tune" function and dipping the plate and adjusting the Load for maximum output, however, when I would turn the gain down to lower the output(thinking I would stress the tubes less), the tubes actually showed more color with less drive. Im sure that Larry at T and T will be able to figure out what is going on. The truth of the matter is- Ive never owned one of these before, so I really would not know what to expect from one. I have however, used PA?with tubes as well as hybrid rigs with tube finals, so while I certainly am NO expert on the issue as im sure some of you are, I am somewhat familiar with the tuneup procedure for devices like this.?I will say that it seems like it is running good in terms of output and so forth set aside the tube color issue and the fact that the tube shows more color with less drive. Possibly, I am detuning the PA circuit by turning the gain down?? It is acting as such. Of course, I would understand showing more tube color if the plate or load were incorrectly adjusted. But as it stands-when transmitter is tuned for max output via tune-plate and load----more drive= less cherry color, less drive=more color. Still seems backward to me, but im sure there is a simple explanation for it or for what I am doing wrong.
At 300mils, I see about 100-110 watts out. Thanks so much for all your help. I cant wait for Larry to get back to me with his findings.

> im trying to not exceed that of course.
>
First, the tubes should NOT show any color when running resting
current. Generally speaking, when one tube shows color, it indicates
that the OTHER tube is not carrying it's share of the load. Matched

pairs of finals are not required, but are recommended for minimum distortion. The difference between statically or even dynamically matched finals is real, but a pair of NEW tubes of the same brand are "close enough".

The bias adjustment should be to 0.1A. Ohm's Opinion tells us that this is 65W of plate dissipation in two tubes that are rated at 16.5W each. There are a couple of factors that mitigate this seeming problem. One is that the 16.5W rating is for a tube that is running all day, closed up in a cabinet with 20 or so other tubes in a color TV set. Another factor is that this condition is only present between code elements or speech syllables in actual use, plus the VOX delay at the end of each transmission. Fortunately, short term overload is something that vacuum tubes handle very well, unlike their SS cousins. Since the final stage in the Drake transmitters is designed to operate as a LINEAR amplifier, it is NOT a good idea to operate the finals with less resting plate current than Drake recommends. That current sets the operating point of the amplifier, and affects the linearity and therefore the "cleanliness" of the transmitted signal. Certainly more of a problem on SSB than CW, but insufficient bias can result in spurious transmitted signals in CW, such as key clicks and other distortion products.

> However, on those higher bands, plate dip still corresponds to
> maximum power out.
>

Secondary plate current dips indicate improper neutralization. Here again, mismatched (different brands) of final tubes can cause neutralization problems. Some brands of 6JB6s are difficult or impossible to neutralize without modification to the transmitter, and mixed brands of finals are just asking for headaches! Aside from that, I find it easier to first perform the neutralization test on 15 or even 20 meters, where the adjustment is a little broader and easier to find. Then switch to 10M and refine the adjustment, which should take only a very small (if any) touch up.

> more than 100w.
>

A far better procedure is to tune the transmitter for maximum power output in the TUNE position. This adjusts the final for a proper match to the antenna and best efficiency and linearity. Then if you want to

run less power, reduce the GAIN control for the power you desire. If you are running reduced power to save electricity or for some desired QRP reason, that's fine. But other than that, the Drake transmitters will run full power for as long as you want them to in CW or SSB. The KEY to long final tube life is to ALWAYS ensure that the amplifier is tuned for minimum plate current as quickly as possible. The very feature that made TV sweep tubes desirable as final amplifiers, (their ability to draw very high plate currents at relatively low plate voltages,) is what will kill them quicker than a lower perveance tube such as a 6146 or 807. IF you tune them up properly, keep them neutralized and don't operate the transmitter into the wrong antenna (!) 6JB6s will last for many years. I have "well used" T-4X and TR-4 transmitters with 6JB6s that have been running for over 10 years. The other thing that will greatly extend final tube life is a small fan on the top or back of the final plate cage, blowing air _OUT_ or _UP_ . It doesn't have to be a big fan or sound like a B-29, just a silent, gentle flow of air to move heated air away from the final.

Subject: [drakelist] Drake For Sale

Hi all;

I am in the process of moving to the west (Grand Forks, BC and am downsizing the shack to help accomplish this. As such many of my prized Drake pieces are for sale. Please see the attached list and any responses should come directly to me, not via the list. Note there is no duty/tax on American made gear when importing to the US. Shipping cost via Canada Post is extra.

Hammond 4-bay sloped front lighted rack console/desk. As in Fred's station at the Hammond museum. http://www.hammondmuseumofradio.org/visit.html Look for W8RO's pic. $800 OBO

EAC Radiomarine R-8 version of Drake RR-1 - $400
ITT Mackay version of Drake RR-1 - $500

TR4C/RV-4C/AC-4 - $550 mint!
TR-4/RV-4/AC-4 - $400
TR-3/RV-3/AC-3 (updated PS board)- $300
TR-4CW/rit/RV-4C/AC-4 - $900 (ouch I know but that's what they get...and more!)

TC-2 2m transmit converter with power cable - $250
CC-1 converter console with SC-2 2m rx converter/xtal calib and power supply - CC-1 cabinet has been nicely re-painted and looks near original - $250 or $200 with TC-2. The TC-2 needs the SC-2 to work.

R-4/T4X/MS-4/AC-4 - some copper chassis spotting on R-4 but works fine. $400
R4A receiver - $225 - really nice.

Drake "communication stations"
R4C/T4XC in a CA-1 stacking cabinet with SSB filter/4NB blanker/ Ac-4 PS and MS-4 Spker - $800

TR-44 - this is a T-4 reciter and R-4 receiver in a stacking cabinet, with AC-4 PS - $400

TR-44B - this is a T4B reciter with R4B receiver in a stacking cabinet with AC-4 PS - $500 - Good condition.

VERY rare TR-44C - this is a RARE T4C reciter with R4C receiver, 4NB noise blanker, AC-4 PS - $1,000 - Cabinet has been nicely repainted - looks

terrific!

TEN TEC RX-340 DSP receiver - Works and looks great. BITE test fails for some reason.
$2500 (sells new for $4250 US + the exchange duty and tax brings it to over $5k)

Mackay Marine MSR-5050A - tuning glitch - encoder skips a bit. excellent shape - $900 with 8 spare boards and full technical manual.

Thanks and 73

John -

If you are referring to an "entire" set of tubes, it's highly unlikely that you actually NEED an entire set of tubes.

If you are referring to finals, yes, the Sylvania brand tubes seem to give the best life and output across the board. MOST brands of tubes will work OK, but there ARE variations in manufacture and operation. The "later" tube brands, such as "Standard" and others that appeared in the 80's, are generally NOT as good and some won't work at all! By then, tubes were being manufactured in only a very few factories, some offshore, and sold under various brand names. Keep in mind that the 6JB6 was designed to run at 15 kHz, and you can see that there are a lot of things that can go wrong if you try and make them work at 30 MHz. To my knowledge, Sylvania was the only company that actually tested and characterized the 6JB6 (and a few other sweep tubes) for use as linear amplifiers at 30 MHz.

That said, most of the major US made tubes of the era will work just fine. Zenith branded tubes appear to have been supplied, at least primarily, by Sylvania and work essentially the same. Drake at times shipped new units with RCA brand tubes, and GE brand also work OK. The GE tubes seem to drop in output power faster than the others, but only about 10% and then last about the same for the rest of their life. Beyond these four, things get a little more "iffy". Westinghouse and Raytheon brands seem to have more variation, some work, some don't.

Aside from the ones that just don't work at all, the usual problem is neutralization. Some "squirrelly" tubes can be made to work by modifying the padder capacitor across the neutralization trimmer to accommodate. Drake published an errata sheet covering this, but basically it just says you might have to change that fixed cap to get the trimmer in range.

The thing about "matching" is that if a pair (or triplet) of finals are not matched, one may end up taking more than it's share of the load, causing additional distortion. Distortion in a linear amplifier goes up quickly when a tube is overloaded. So if a mismatched pair that is loaded to the nominal plate current of 340 mA and one tube only draws 140 mA the other tube has to be loaded to 200 mA to reach that current. Generally speaking, a pair of NEW tubes of the SAME "good" brand are close enough. Most tubes sold as "matched" are only matched at a single current, leaving room for error anyway. You can match your own tubes in the T-4XB by putting a DMM across one of the cathode resistors in the PA (R32 or R33), pulling out the tube in the OTHER socket, and with the GAIN control CCW, close the PTT and adjust the BIAS

control on the AC-4 for 35 mA plate current (idle per the manual). Record the voltage from the DMM, (should be about 2.55 VDC,) unkey the transmitter, wait 30 seconds and then short the final plate cap to ground. Remove that tube, replace it with another, and repeat WITHOUT adjusting the BIAS control, and record the DMM reading for that tube. Repeat with however many tubes you have, and then select the pair with the closest readings. The closer the better, but anything within 5% or so is close enough. While you're in there, and preferably before doing your matching, check R32 and R33. These are often out of spec, especially if the transmitter has been mistreated. They should be within 5% of 15 ohms, and again the closer they are to each other, the better, as this balance also affects the matching of the pair of finals. If replaced the Ohmite brand of OX/OY resistors are the best replacement, preferably the 2W version.

The best thing you can do to extend the life of your final tubes is to add a small fan on the top or back of the transmitter final cage. It doesn't have to be a monster, just place it so that it is blowing UP or OUT. It can be powered from AC or from rectified filament voltage from the transmitter if it's a 12 VDC computer style fan. You're not trying to "air cool" the finals, just get the heat out and away from them. The fan, and of course care in keeping the finals "dipped" at ALL times, and QUICKLY tuning up into a MATCHED antenna system will let good finals last for MANY years, even in AM service. I ran three sets on RTTY at full power for 30 minutes or more and got years of service from them. But being slow or careless in tune-up will kill them in seconds. The very thing that makes them desirable as finals, high plate current at relatively low plate voltage, will kill them if mistreated.

Subject: [N3FJP_Software] WX Spotting Log 0.2 - BETA Testers Needed!

Hi All,

In addition to Amateur Radio, I've always been very interested in weather. I've had an idea for a while now (I think I may have mentioned it before) about a WX Spots server that would function very much like DX Spotting. It would give everyone the opportunity to monitor and post, real time weather information along the lines of SkyWarn protocols.

We continue to hear that with all the automated data available today, there is no substitute for real time observations during severe weather. On Monday July the 16th, we had a very minimal tornado touch down a couple miles from our home. The damage wasn't too bad, but it did wind up closing a major roadway for over a day due to trees and power lines down. Watching that process unfold on the news, it became obvious how necessary visual reports really are to quickly assess the extent of storm damage, and it got me thinking about
this idea again.

In a nutshell, here is the idea:

- Everyone (the clients) connect to a server, which relays real time observations back to all clients

- The clients have the option to display all data, or screen by state or county

- Audio alerts can be specified by the user based on the location

- A messaging feature is available to allow for communication with other members of your organization (and any other connected users).

I shared this idea on the N3FJP_Software_Users group a few weeks ago and the response was enthusiastic, so between the code that I have already written for the WOTA server and modules for the logging software, I've cobbled together the basic client and server to perform the described functions.

We've been beta testing for about two weeks, and I'd like to get more users on the server to give it a good run through. You won't find it on the website yet, but if you have an interest in this project, please download the installation file by clicking on this link:

http://n3fjp.ky1v.com/WXSpot.exe

If you are involved in Skywarn or something similar, right now is a great opportunity to have the other members of your group to also give it a try since, while in BETA testing, reports are assumed to be fictitious. Everyone is encouraged to try sending reports and

other features to get comfortable with the software. Please try all the features and let me know of any bugs that may come to light.

Since this project is a little different than my "regular" logging software, I have set up a separate e-mail group for this project:

Click to join WXSpots

WXSpots-subscribe@yahoogroups.com

After you subscribe, please send e-mail regarding this project to WXSpots@yahoogroups.com. One of the goals of this project is that support will be provided by the user community.

As always, thanks for your support and kind words, and in advance for trying out this program!

Martin,

If you did not receive them with the kit you can try asking the developer, Mike Bryce WB8VGE The Heathkitshop, SunLight Energy System. If you can not get a copy from him let me know wmilton at comcast dot net. I will scan and email you a copy. The instructions are 5 pages double sided.

Hello Mike i bought use Drake and AC4R so i dont have the ac4r manual.
If you can scan me and send it it will be VERY usefull for me.
Tnx
Best 73!

387. #12 lamp in TR-4 question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-08-15 22:25:59 UTC
From: Mike-K5VSE
Topic: 387 Message: 387

Can anyone on this fantastic list tell me whether all TR-4 transceivers had the 2 pin #12 lamp in the antenna circuit? I have checked everything I can think of, and still have a weak signal input, but can not seem to locate the lamp used as the fuse.

Any and all suggestions welcome.

Thanks es 73

Please disregard the above post.I found it. Someone in the past has
soldered in a grain-O-wheat lamp in place of the #12.

Thanks again,
Mike

Mike -

TR-3 and early TR-4 had the lamp mounted inside the final cage on top of the chassis. Later it was moved under the chassis when the relay was changed. A #12 bulb has the same ratings as a #47, so wire leads soldered to a 47 is a good sub until you can find a 12.

Thanks Garey,

I got plenty of #12 lamps. I bought a lot of them when I was restoring some Gonset GSB-100 transmitters. They use about 6 in each one. The grain-O-wheat is open and it is mounted in the final cage right near the open frame relay.

391. C Line questions

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-08-16 21:34:23 UTC
From: dynamic881964
Topic: 391 Message: 391

Hi ,
Recently traded and got a nice Drake C line. The transmitter would not mute the receiver but it did work. . .Once ! Next morning, I tried tuning it up but since that one time, it has had no output. I changed the driver tube and the 6EV7. The relay has been replaced. It acts like it is tuning up normally but no output on my swr/pwr meter.
Other than the above the receiver works great and right now I am using it with my old Kenwood TS520s for the transmitter. Trouble is, I see no place on the 520s to connect the R4c's mute cable.
I do have a second power supply for the T4XC and tried it, to rule out power supply problems with same results. Finals shot ?
The one time it did work, I made several contacts , got great signal and audio reports and the swr was 1.1 to 1 so that wasn't the problem.
Any help / suggestions greatly appreciated !
I love the Drake line and want to get it going as it should.
73's,
D aka KC8YOX

Hello i bought a TR4C with a AC3 upgrade to AC4R.
The VOX have a problem.
I use it at CW mode.
The VOX is working but i can not adjust the delay. I turned VOX and antivox pot and NO effect.
I checked 6EV7 voltage and resistance with chart and it is all OK.
any idea ?
Tnx
Martin

Martin -

The only external adjustment for VOX Delay in the TR-4C is the VOX control. The higher (CW) the VOX control, the longer the delay. Setup is to advance the VOX control just enough to reliably activate the relay, any further will increase the drop out time.

Resistor R106 in the VOX amp section, (V19), can be changed to adjust the delay. Nominal value for R106 is 3.3M. Most likely R106 has gone up in value with age, lengthening the delay time. Alternately, R106 may have been changed by a previous owner to extend the delay.

In excellent condition. Second owner. Tubes are in excellent shape. Original chimneys.Cosmetically this amp is a 9 out of 10. Also have the L-4 Power Supply in excellent condition. I am presently using this amp and pwr supply on the air. I also purchased all the components and double fans to rebuild the power supply on the present existing factory boards. This will also go with the sale. I will sell this for $950.00 plus shipping. Hopefully there is a local that is interested. Pics available to serious inquires only please.

Hi John,

According to my old catalog, the L4-B is 32 lbs, and the power supply is 43 lbs.

Hope that helps you. Remember, that is without packing boxes etc.

My tr3 works great on 20 and 40 m. I get great audio and signal reports... however on 80m I am told the audio has no low's and is very tinny sounding. I've changed the 6EV7 mic tube with same results. Also when listening on 80m the signals heard are all full of highs with no bass heard.
Any help ? Suggestions ?
Thanks !

One of the sideband filters has gone to the big sand pile in the sky.
You can retune the carrier osc to get slightly better sounding audio on
the 80 meter position but it will not be as good as original.

It is possible (lots of work) to replace the original "soup can" filter
assy with newer filters from a later model rig or buy new ones from
Inrad. The cost will greatly exceed the value of the rig.

I haven't heard of anyone repairing the original filter. It is possible
to do if you have access to a crystal making factory so you can get the
proper matched crystals. The soup can can be unsoldered so you can see
what is in there. Used standard HC6?? crystals.

Dave -

The problem you are seeing is one of two problems.

One is fairly simple and easy to rectify. The Carrier oscillator is off frequency, (should be 9.0000 MHz,) but if this is the problem one band will be high pitched and the other will be low pitched. The fix is to adjust the trimmer cap (C130) on top of the right rear corner of the chassis for 9.0000 MHz if you have a counter, and then "fine tuned" for equal noise pitch on both filters in receive. This is described in section VIII, B in the manual. From your description, this is probably not your problem, since the "good" sideband doesn't sound "bassy", and you probably won't be able to find a spot where the noise is equal.

The other possibility is much more serious and is usually the problem when one sideband is "good" and the other is "bad". I haven't ever worked this all the way out, (Al Parker, W8UT probably has!,) but even though 40M is LSB, and 20M is USB, because of the mixing scheme used in the TR-3/4 the same "half" of the filter is used on both bands. I believe 80M uses the 'other half' for LSB and that half of the "soupcan filter" has failed. You can check in receive, by tuning in the calibrator and slowly tuning through the steady signal while watching the S-Meter. As you get close to the Cal frequency, the S-Meter will start to rise fairly rapidly and if you keep tuning in the same direction the meter will peak, remain fairly steady for a couple of kHz, and then rapidly fall off on the other side back into the noise level. This pattern follows the shape of the filter curve shown in the manual. What you will probably find is that one side of the filter will behave this way, and this is the half used on 40 and 20M. The other half will probably have a much narrower peak, and there may even be a "step" in one side of the normally steep sides.

Hi Gary,
Tried what you suggested (as did Larry Thanks to both of you !) ,
but with no luck. The 9mhz osc. adjustment made very little difference
but there was a very tiny improvement.
I guess the filter is shot but I can't seem to locate a replacement
and am guessing no one make them ?
This rig is my favorite but oh well guess it will be limited to 20
and 40m for now.
Thanks for all your help !!!
73,
Dave

Dave,

You might check the "E" place. I just saw a TR-3 parts rig at a very low price. Can't remember how long it has left, and it has some tubes missing and no cabinet.

Just a thought!

Unfortunately, that's often the reason a TR-3 or early TR-4 has been parted out.! It's one of a very few "unobtainium" parts in the 4 Series transmitters/transceivers, and a relatively high failure rate part. The filter assembly is a "handmade" device, eight individual HC-6/U crystals and a couple of caps wired up to the back of a rotary switch and soldered into a tin-plated can. (Hence the "soupcan" description.) Most likely one of the crystals has failed. At best, it's a four-pole filter, which is marginal by today's standards, resulting in less carrier suppression and poorer unwanted sideband suppression at low audio frequencies. Later filters were eight-pole, much steeper skirts and therefore better carrier and unwanted sideband suppression.

So unless the rig has sentimental value making it worth the $200+ expense of the Inrad filters, or retrofitting later twin hermetic filters with the inherent risk of getting stuck with _another_ bad filter from a less than honorable seller, it becomes a "parts unit". Sound familiar?!?! :-)

If you are of the homebrewing nature, there are programs available for designing ladder filters (EMRFD has a great one) and computer crystals are dirt cheap. They are cheap enough that you can buy a few dozen and select appropriate matched pieces to make a single filter. I don't know how many you'd have to buy to be able to select enough for TWO filters spaced the appropriate distance to allow the use of a single carrier oscillator frequency!!

Hello to all
i am cleaning a TR4C, fix the delay vox (tnx to Garey - K4OAH)
and now the front red neon is light. Maybe with years it become not
very bright
or voltage drop ???
any idea ???
tnx

Martin -

Neon bulbs do tend to dim with age. The glass is darkened by material sputtered off of the electrodes.

You could check R164, if it has gone up drastically from it's nominal 33k, but usually the voltage just drops to where the bulb doesn't fire at all.

The bulb itself is an NE-2E, which nowadays is known as an A9A. This is a tubular glass bulb (0.25" dia or less and 0.75" long or less) with wire leads out one end. You might be able with care to dig out the material that is filling the back of the red plastic part, remove the old bulb and replace it with a new one. I've never tried it, so don't know what the filler material is. Perhaps a hot soldering iron would melt it out? I know it will melt the red plastic part!! Possibly the "plug" could be "drilled" out with a twist drill held in a pin vise? Perhaps "chewed" out with a small grinder or Dremel bit?

411. Drake Microphone Jacks and original Drake Manuals FS

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-09-01 14:56:54 UTC
From: Ken Simpson, W8EK
Topic: 411 Message: 411

For Sale:

I found a couple of 0.206 inch chassis mount jacks,
similar to what is used in the Drake gear for a microphone
jack.

Both of these appear to be unused, never soldered to. One
is labeled JJ-033 and the other SCA-2B. They are 2 conductors,
plus the ground. $5 each

Original Drake Manuals for sale:

Drake TR-33 C transceiver
Instruction manual for the 2 meter rig.
It even includes a warranty card, welcome letter,
and 1978 spare parts price list.
Close to new condition. $10

Drake AA-10 power amplifier
Instruction manual for the 2 meter amp.
Close to new condition. $6

Prices do not include shipping from Florida.

Thanks.

Hi All,
Good news. I got the TR3 working and without any filter problems.
I had to go away for a funeral and while there, found some Caig
De-Oxit . Bought it, got home cleaned the band switch and function
switch, also the tube sockets.
She works fine now on all bands with good reports on signal and audio.
I love the rig (always have).
Thanks to those who replied and best of luck to all in the group.

416. Looking For 9.0 Mhz IF Crystal for TR-4

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-09-18 09:31:58 UTC
From: Bill
Topic: 416 Message: 416

Hello everyone. I been meaning to ask the Group for awhile now if anyone out there has a 9.0 Mhz IF Crystal For a TR-4....I think thats what I need to get the ole girl going again. It is located on the bottom side of the radio in the back of the radio near the Ground stub....One of The wires on the crystal broke off even with the bottom of the crystal. i am hoping that I have it pegged correctly as the 9.0 Mhz IF Crystal. My eyes just are not what they used to be.....The radio is in outstanding shape and was just serviced not long before the wire on the crystal broke. I got mad because it broke so soon after being re-aligned and serviced and all that I just went out and bought a Icom 706 but it broke after a couple of years and I was told that it would be cheaper to replace than to repair. So I got mad again and got the Kenwood TS-2000...I have been very happy with it and it works great. But I sure do miss the glow of those tubes. and with winter comming on I could use the extra Heat in the Shack...LOL....It is a great rig to operate and I hope to have it back on the air by winter....If anyone out there has what I need please let me know, and also let me know how much and the best way for me to pay you.....Thanks everyone. I'll be sitting here with my fingers crossed.....

Does anyone have a TR-4C with a serial number below 34150? Or a TR-4 ABOVE 34150??

Possibly a schematic of either numbered "around" 34150?? I believe the schematic date is 32473, but not clear.

Thanks for looking!

John -

First question is do you have a key plugged into the transmitter? SOME
of the T-4X series will not key in TUNE if there is an open key plugged in.

Next thing to check is the back panel of the transmitter. IF there are
two RCA jacks near the center of the back panel, _vertically aligned_,
the transmitter has been modified for use with the external
transverters. This modification disconnects the screen voltage from the
final and would cause your problem. You need to connect a cable between
those two jacks to restore screen voltage.

IF the jacks are NOT there, just two holes where they would go, that's
not the problem!! :-)

Next is to see if the relay is pulling in when you switch to TUNE mode.
You should be able to hear it click when you switch to TUNE, and click
again, after a short delay, when you switch back to standby. IF it does
NOT click, you could try substituting the 6EV7 tube if you have a
spare. If you don't have a spare tube, you can measure the voltage on
the Plate of the 6EV7, Pin 6. You should see about 200 VDC. If you see
NO voltage, they relay coil may be open.

If the relay clicks but you still have no Plate current, further
troubleshooting will be required. You may have a relay contact that is
bent or broken, a broken wire, or possibly even a corroded switch
contact. "Exercising" the rotary switches will usually clean the
contacts sufficiently, unless the transmitter has been stored in a very
unfriendly environment.

Gary,

Thanks for your help here is what I see so far. No mods for a transverter. I was wrong about the rig not keying it is the relay is very quiet, It does key when put in tune and in ssb with the mic. I do not see any voltage on pin 7 and the tube tests ok on my tube tester. I have cleaned switches and relay contacts with DeoxIT and the relay contacts LOOK ok.....John

OK.

I assume you have measured the plate voltage, which should be about 700 VDC no load, 650 full load. You can verify that you have HV at the plate cap of either final tube.

Make sure that the Meter switch on the front panel between the TUNE and LOAD controls is in the OUT position. Exercise that switch by pushing it in and out a few times.

It sounds like the cathodes of the final stage are not getting to ground. All that's necessary for Bias current is that the HV and screen voltage are present, the Final filaments are lit, and the cathodes of the Finals are grounded.

All Final stage voltages can be checked at the feedthroughs along the side of the underchassis shield next to the PA compartment. Starting closest to the rear of the chassis, they are as follows:

1 - Plate Supply (+650 VDC)
2 - Cathodes (should show close to 0V when keyed).
3 - Screens (+260 VDC)
4 - Grids (~ -55 VDC)
5 - Filaments (6.3 VAC)

If these voltages are correct, the next step is to turn off the transmitter, disconnect the power supply, (wait a minute or so and then short #1 and #3 above to the chassis,) and do some ohmmeter checks.

Gary,

All voltages seem fine cathodes do show about 5 volts filaments show
12.6 volts not 6.3 but I think at the feed threw that is correct,as filament
voltages look ok at the tubes. Plate voltage at tubes 696vdc.....Makes my
head hurt.....Hi Hi

Yes, you are correct. Should be 12.6 VAC at the feedthru. That's what
I get for going from memory.....

If you have 700 V on the plates, 250 V on the screens and 5 V on the
cathodes you should be drawing plate current, settable to 0.70A with the
Bias control. No other connections or voltages needed! Check the
voltages at the tube sockets and at the plate cap of the finals.

Voltage at either Plate cap of the final = 700 VDC.

Voltage at Screens (Pin 1 or 7) = 250 VDC.

Voltage at Grids (Pin 2 or 6) = ~ -55 VDC.

Voltage at Cathodes (Pin 3) = ~ 3-5 VDC.

John -

Nope, that's getting closer to the problem. The voltage at either Pin 3 of the Final tubes should be a volt or so at most.

There are 15 ohm 1W resistors from each Pin 3 to a common point, an RFC from there to the feedthrough, and a 2.7 ohm resistor from there to ground when in TUNE mode. Measure the voltage at each Pin3, at the common point, and at the feedthrough. Sounds like either the RFC is open or the 2.7 ohm resistor is. Other possibilities are a bad relay contact, switch contact, etc., depending upon where you read close to 0 volts!

We do this for fun... We do this for fun... We do this for ...

From: Garey Barrell
Topic: 438 Message: 442

Ah, progress!! Sometimes the wire loosens from the pie and breaks off
where it is soldered to the lead. Obviously you can pull off a turn or
three to get enough to repair it. 5-10 turns wouldn't hurt if necessary.

John -

I believe that's a 750 uHy choke, probably should be rated at 500 mA,
but likely is less than that. Certainly it has to handle the full plate
current, which is typically 350 mA at resonance, but can go to 400 mA or
more off resonance. Hopefully, (for the final tube's sake!,) that off
resonance current won't be for very long..... :-)

I have replacements here somewhere, but my parts units haven't surfaced
yet since the move. If I can't find mine, John Kriner probably has them.

Keep me posted!

GAREY,

Had some time and pulled the RFC broken wire was about 7 turns under so I soldered it back and rewound it as best I could. I will do a test tonight (hope I don't let the magic smoke out) will let you know the results.

This radio came to me from an elderly ham and the power supply was shot.He said it just quit one day and did so with a loud bang that was heard across the street? He was outside at the time and said he heard it but I tend to think that was just a quinkie-dink. However the high voltage windings on the power transformer were shot. The rig as I got it had bad final tubes in it as well as this problem hope I don't find any more.

John -

Well that's probably what got the RFC.

I could count on one finger the bad transformers I've seen in 40 years of AC-3/4 power supplies. Most likely the filter cap(s) - or a diode - shorted, which should have taken out the fuse. Unless someone replaced the 6A fuse with a piece of aluminum house wire.! Don't laugh, I've seen it. And the transformer survived, the rectifier

What often happens is that the Bias supply quits, usually as a result of a shorted filter cap, which keys the transmitter (even if in Standby), and with no bias on the finals, they draw max current until whatever lets go. In your case it sounds like it was the RFC.

While you are in there, check the value and condition of the 68 ohm screen resistors and the 15 ohm cathode resistors on the final, and verify the value of the 2.7 ohm meter shunt. These are in the direct path of the excessive plate current along with the RFC and will often change value or just crack. The absolute value of the 15 ohm resistors isn't super critical, but the closer they are to the same value, the better.

Hi Garey- Its Alive,Its Alive Well for the most part! Was able to set the bias and load it up on the dummy load tonight. The magic smoke stayed inside nothing went bang all seemed pretty good till I went looking for the signal. I wanted to listen to the audio on another rig but could not find it anywhere in the band? Glad I was on the dummy load. I guess the Vfo is a Ufo (unidentified frequency oscillator) oh well that's why the call it amateur. So I hooked it up to the R-4b set it up for transceive and after a few cable problems (dirty RCA connectors) and a lot of DeoxIT tried again and damn if it diddent work! I made a contact on 75meters and got a decent report although I was slightly of frequency op error for sure. I still have some bugs to work out and need to learn how to operate it properly also should neutralize the finals although it seems to be as happy as I am.

Thanks for all your help I have learned a lot thanks to you and had fun doing it as well. My next project is a Johnson Viking Ranger and an Hammarlund SP-600. I always wanted an AM station The SP-600 is already up and is Great the Viking is another story. So best 73 hope to work you sometime.....John

John -

Cool! Always nice to get one going again.

There are THREE signals that have to be present for the T-4XB to transmit.

1. The Carrier Oscillator - 5.645 MHz Crystal controlled. (Ya got this one!)

2. The PTO - Variable from 4.955 - 5.455 controlled by Main Tuning knob.

3. Band Oscillator - 11.1 MHz above the bottom of each Band - Crystal controlled, selected by Band switch.

Example for 80M

Band Osc 14.6 MHz (3.5 + 11.1) - PTO Dial set to 000 (5.455 MHz) = PreMixer (9.145 MHz).

PreMixer (9.145 MHz) - Carrier Osc (5.645 MHz) = 3.500 MHz.

The PreMixer signal is what is patched between the two units on the INJ cable for Transceive.

So the diagnosis is ... The transmitter isn't working by itself because _ITS_ PreMixer signal is not present. So Either the Band Osc is not running, (XTALS switch not set to NORM, missing crystal, bad crystal, or bad Q3), or the PTO is not working, or the PreMixer (V8) is not working. When in transceive, the PreMixer signal comes from the R-4B, substituting for all this stuff!

Check position of XTALS switch.
Try another band, eliminate bad or missing crystal.
Listen for the Band Osc on a separate GC receiver. (Might need a wire from GC receiver antenna placed near Q3.)
Listen for PTO on a separate GC receiver. (000 on dial = 5.455 MHz)
Listen for PreMixer on a separate GC receiver. (Should be at 9.145 MHz for 80M Band.)

If you don't have a manual, you might look at my CD at my webpage below. It has CLEAR PDF files of both manual, along with photos of both units with parts identified and located.

Did you check those resistors I specified in the last message?

Do you have bias current on the Final?

While you're in there also check R26. It's another resistor that can be
damaged by heavy overload like this one suffered. R26 can also be
damaged by careless alignment with a metal alignment tool.

They really are VERY reliable transmitters until they are abused beyond
reason. I ran three of them on RTTY Autostart 24/7 back in the 60's
with full power keydown transmissions exceeding 30 minutes with NO
failures aside from one 12BY7 whose filament just opened up one day.

OK

If you have bias current the Final has good DC, indicating that all DC voltages are good. So it's gonna be something "little". R26 is a suspect.

Did you investigate the presence (or absence) of the Band / PTO, or are you still using the receiver Premix to transmit? The INJ cable didn't fall out did it?? :-)

You can check the entire transmit chain (less the Premix signal) by trying to load into a _dummy load_ with the RF TUNE peaked on the signal around 5.5 - 6 with the band switch on 80M. Essentially you are tuning up on the 5.645 kHz Carrier Oscillator frequency.

Keep me posted!

Drake "family" -

I need some help!

Does anyone have a TR-4C schematic with a serial number starting with 32473 ?? I know there is one, but the copy that I have is "blurred" and I am unable to read the last five digits.

The serial number is on the schematic itself, usually bottom center of the drawing.

Otherwise, does anyone have a TR-4C with a serial number below 34150? Or a TR-4 ABOVE 34150??

I'm getting closer to the TR-4 CD, finally!

From: Peter
Topic: 458 Message: 458

Hi, I am looking for some parts for my Drake MS-4. I need two of the feet that thread onto the 10-24 flathead machine screws. I also need a replacement 5x7 4 ohm speaker that has the same hole spacing as the original. Any suggestions welcome. Thanks, Peter.

459. Zenith 6JB6's

Yahoo group: DrakeRadio (2006 — 2011)

From: Garey Barrell
Topic: 459 Message: 459

Perhaps this explains why I have found Zenith branded 6JB6's to work
well in Drake tube transmitters.....

"Interesting note: During the entire Zenith tube equipment era, Sylvania was their single supplier. Such rare and unusual tubes as the 6T5 and initially the 1L6 were manufactured exclusively for Zenith by Sylvania until Zenith either chose not to pay the premium for exclusivity (1L6), or granted permission-by-license to other makers such as Crosley to use the 6T5. "

Thanks Don,
Sorry for the late reply. Darn Low back went out Again...I didn't see what I was looking for on their site. I will call them on the Landline when I feel Better. Thanks again Don...

On another note.....My TR-4 Serial number is 31734. I took this off a old repair Bill..The Little tiny numbers on the Schematic Diagram under where it says Model TR-4 Tranceiver is...8117030500.....There are also Schematic's for 34PNB Noise Blanker, Fixed Frequency adapter, RV-4 Remote VFO, AC-4 / DC-4 Power supply's, And also picture views of the top and bottom side of the Radio...
Hope it helps. Let me know....73's Everyone...

Subject: [DrakeRadio] Looking For 9.0 Mhz IF Crystal for TR-4

Hello everyone. I been meaning to ask the Group for awhile now if anyone out there has a 9.0 Mhz IF Crystal For a TR-4....I think thats what I need to get the ole girl going again. It is located on the bottom side of the radio in the back of the radio near the Ground stub....One of The wires on the crystal broke off even with the bottom of the crystal. i am hoping that I have it pegged correctly as the 9.0 Mhz IF Crystal. My eyes just are not what they used to be.....The radio is in outstanding shape and was just serviced not long before the wire on the crystal broke. I got mad because it broke so soon after being re-aligned and serviced and all that I just went out and bought a Icom 706 but it broke after a couple of years and I was told that it would be cheaper to replace than to repair. So I got mad again and got the Kenwood TS-2000...I have been very happy with it and it works great. But I sure do miss the glow of those tubes. and with winter comming on I could use the extra Heat in the Shack...LOL....It is a great rig to operate and I hope to have it back on the air by winter....If anyone out there has what I need please let me know, and also let me know how much and the best way for me to pay you.....Thanks everyone. I'll be sitting here with my fingers crossed.....

Subject: [DrakeRadio] Need TR-4c Sideband Switch

Working on putting life back into a TR-4c and appears it took a hit on

the sideband selector knob and broke the switch wafer in half.

Wonder if any of you fine folks here on the Drake list have a parts

radio with this switch in it or switch available?

Thanks,

Dave, K8DV

465. No output from L-4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-10-13 14:59:02 UTC
From: Robert H Clinton
Topic: 465 Message: 465

I have finally gotten around to activating an L-4B that I bought from a trusted source about three years ago. I am using an Icom 706 as the exciter. I get no power out of the L-4B and no plate current is indicated. Grid current is rated value as specified in the instructions. Plate voltage, indicated on the L-4B meter, is normal. I checked the 120V standby bias and it goes to 0V when changing from standby to operate. Per the instructions, I checked the 3-500Zs for grid-to-emitter shorts and both are OK. (both tubes light up). I do not have spare tubes available and, given the cost, I am reluctant to get new ones unless I am certain they need replacement.

Any suggestions would be appreciated.

Bob Clinton

Do you have idling plate current when the amp in keyed, with no signal applied? Have you checked the HV going to the plates of the 3-500Z tubes? Don't try that unless you are comfortable working around very high voltages, as it can kill you! The relay can also be a problem, although unlikely. There would be some output, even if low.

Let me know how you make out.

Topic: 465 Message: 467

Mike,

Thanks for coming back with your suggestions.

<<Do you have idling plate current when the amp in keyed, with no signal applied? >>

The on-board meter does not show any plate current under any set of conditions.

<<Have you checked the HV going to the plates of the 3-500Z tubes? >>

So far I have not tried measuring the HV directly at the plates of the tubes - I have relied on the on-board meter, which indicates normal plate voltage. However I can see that this is not a definitive test. I don't have a meter that can measure the plate voltage directly, so I will have to assemble a voltage divider.

<<The relay can also be a problem, although unlikely. >>

I have been suspicious of the relay but it appears to be working. I know that it is actuating and it removes the cutoff bias when it does.

The next step is the direct voltage measurement. Thanks for the HV warning, but I am fairly comfortable working with HV. I was a US Navy Electronics Technician back in the days of wooden ships, iron men and transmitters with high voltage and huge final amplifiers.

Will let you know how I get on.

Mike,

Your suggestion about measuring the HV at the plate caps sent me first to the schematic and then to the bench with an ohmmeter. The only thing that could allow a normal HV reading on the on-board meter but keep the HV off the plates is an open RFC 4. Sure enough, it is open. I think I can see a dangling wire at the bottom of the choke. I didn't attempt to fix it tonight - the patient will go in for surgery tomorrow.

Await further developments.

Glad I could be of service. Meters don't always tell the whole story, and can sometimes run you ragged looking for a problem that doesn't exist. That's one reason I have kept my old Triplett VOM, because it will measure hi voltages. I enjoy doing these things myself. Hope all works out well for you with the amp.

Mike,

The moral of the story is: if you want to measure the plate voltage,
measure it at the plate connectors.

I repaired the open circuit this morning and now I have output.

Thanks for pointing me in the right direction.

476. Capacitor Value for Drake TR-4?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-10-17 12:20:16 UTC
From: Mike-K5VSE
Topic: 476 Message: 476

Hi to all,

OK, don't go off on me, but I have a stupid question. What is the value of C-145, a multi-section electrolytic capacitor in the TR-4? I can find two of the values on the schematic, but not the others. I can't read it off of the cap because of the way it is mounted on the chassis. I have AC hum in both transmit and receive audio. The AC-4 is fine, as I have swapped it out with another from the twins.

I have asked several people, but got no response. Any and all help will be greatly appreciated.

You may answer to my email direct if you so desire to:
mdewey@...

Thanks es 73,
Mike/K5VSE

477. Re: [DrakeRadio] Capacitor Value for Drake TR-4?

Date: 2007-10-17 13:57:42 UTC
From: Garey Barrell
Topic: 476 Message: 477

Mike -

I have spent the last year developing a CD for the TR-4, and in the last few weeks have been poring over the schematic and parts list.

So...

C145A is 20 uF at 250 VDC (located near J3)
C145B is 60 uF at 250 VDC (near S-Meter)
C145C is 10 uF at 25 VDC (cathode bypass on V19A)
C145D is 10 uF at 250 VDC (near J3)

While the voltages are "DC Working Voltage" for electrolytics back then, the 250 is directly across the 250 VDC supply and so is marginal, especially with todays higher line voltages making the +250 V line closer to +270 VDC. Four section Twist-Lok caps are also kinda rare these days, so you'll likely have to settle for a three or even two section can with the others being replaced by tubular caps placed below the chassis. Lead length is of NO concern for these caps, so you can place them where they can be fitted in.

If you want to "re-stuff" a Twist-Lok can, you could find a little taller can than the original that would accommodate all four sections. I think it would be tough to get all four into the original 2" tall can.

Thanks Garey,

I've been trying to get these values for some time now. My T-4XC has problems, so I have reverted back to the TR-4. I'll start looking for something close that will fit. So far, over the years, I've always been able to find something that will work when it comes to capacitors.

Hey George,

While you're at it, you might look and see if ya have an R-4C with a ser# above 21xxxx. Don't ask me why, but someone told me that the one I have is the earlier version using 6HS6 tubes instead of the 6EV7 I think. Supposedly Drake changed the 3rd mixer as well, and it is supposed to be a better receiver. At least you can add more filters, that I do know. I don't know if I can afford it, but I can always sell off some of my other stuff. I have a guy wanting my Kenwood twins real bad, he's just trying to come up with the cash.

Thanks for your trouble, and I'm sorry for being a pest. LOL

485. wanted: Drake SW-8 service info

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-10-19 22:55:41 UTC
From: mikemaghakian
Topic: 485 Message: 485

Does anyone have the SW-8 service info package that they don't need anymore that they want to trade to me.
I have fixed up my SW-8 and want to look into mods and other interesting projects so that info would be nice to have.
If I can trade something I don't need for something you don't need then we both benefit.
I do not want home made copies, I prefer what originals Drake sent.

thanks

486. Wanted: Drake L-4(b) vox cable to PS

Kevin -

Those cables (actually the connectors) are almost impossible to obtain. They show up on E* once in a while for $20 and up each. I have seen a cable somewhere with "home-made" connectors that looks pretty good for about $20 or so, but can't recall where at the moment.

Drake offered a modification consisting of a small plate that fit over the rectangular hole in the AC-4 and the L-4B with an RCA phono jack mounted on it so a regular patch cable could be used. John Kriner may have some of those kits left, but it would not be very difficult to fabricate.

As for the original connector, the pins are 0.093" in diameter. Some have made a connector from #11 solid copper wire. Various schemes have been tried with plastic and/or epoxy to build up a connector body around the two pieces of wire. #11 wire is 0.0907", and tinning it with solder should make it just about right. I would tin it to ward off corrosion. Unfortunately, #11 is NOT a common size (to say the least!). #10 is 0.1019", which is a little large, and is probably what the "plug builders" used. I don't know if that is large enough to damage the female connector or not. The pins are spaced 0.350" c-c. A better choice might be some 3/32" dia (0.0937) brass tubing from the hobby shop. It would give a more reliable electrical connection to the wire.

Here's a sample

<http://www.zerobeat.net/drakelist/voxrelayplug.html>

John does have the mod kits at $12 each.

This is the one I saw. Unless you have a very late AC-4, you'll have
to modify one unit to use this cable.. The late AC-4 had the phono jack
from the factory, but the rest have the same two-pin connector that is
on the amplifier.

491. T4XB no transmit problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-10-22 03:11:30 UTC
From: tweeker42000
Topic: 491 Message: 491

Hello group:

I am new to this and to drake equipment. My addiction to boatanchors started with some Hallicrafters equipment, and I just recently picked up a Drake T4XB. When I got it home and fired it up I was able to get bias, but turning up the gain control resulted in no output, no plate current on the meter. I started out by checking all the voltages and found them to be OK, I checked all tubes in the path and they were OK as well. I checked the carrier osc at pin 3 of V1A, checked the PTO at pin 7 of V8, checked the band osc at pin 1 of V8. I have the mixed output from the plate of V8. The cathode voltage on the mixer and IF amp changes from 150 to 1-2V when I switch it to tune.

What I have noticed is somehow the signal from the Pre-mixer is not at V3, and I do not have have DSB output from the balanced modulator. There are alot of switches and I did not get time to trace it through tonight - but I did verify that the driver and finals can put out a signal at 3750 by injecting a signal to pin 2 of the 12BY7 driver. With 8dBm I got 50 watts out, and with 13dBm I had 100 watts out. I also had a plate current indication on the meter. So it seems that circuitry is working.

So has anyone seen the premix signal not getting to V3 (I looked for a signal at R15/C146) -- Anything simple? your help is much appreciated!

Regards, Ryan, N7QJ

Ryan -

Sounds like you are pretty knowledgeable, and have done all the "right" things. Makes it tough! :-)

Your message is a little ambiguous about the presence of the Premix signal at R15/C146. Is it there?

A "working" T-4XB can be tuned up at 5.645 MHz by inappropriate setting of the RF TUNE on 80M, eliminating the requirement for the Premix signal entirely, to check the signal path.

You don't say "where" you don't have the DSB signal. The signal at T3 should be SSB, depending upon the SIDEBAND switch setting.

Just a guess at this point, T3 or surrounding wiring may have a problem. The Premix is injected into the "bottom" of the T3 secondary via C146, while the SSB is coupled in via the primary of T3.

Let us know what you find!

Thanks to all that replied. I was able to make one up. I had looked thru a box that I had of old connectors I picked up from ham clubs that were giving them away. The amp works great.

Thanks again,
Kevin

Garey,
Well, I spent some more time on it tonight and the short story is
that it is working now - something is intermittent in the vicinity of
the switches and/or T14. The signal was there at R15/C146. I shut
it down tonight and will see what I can get with it tomorrow.
Tapping around did not make it stop working. We'll see...

Thanks, Ryan

Ryan -

OK. There have been a few reports of trouble with T-14. The four diodes of the Balanced Modulator are INSIDE T14, pretty tightly packed, and can short against the can, which is not good! :-)

The originals are germanium, usually 1N541, a few 1N270. Best to replace them, IF necessary, with 1N5711 or similar Schottky diodes.

CAIG DeoxIT, D100L if you can find it, if not D5 sprayed into the cap and put directly on contacts with a syringe or pipette, will resolve most switch problems. Some claim that with some spray "cleaners" will cause the phenolic wafers to swell. I have seen ONE case where the phenolic wafers were distorted enough that the contacts were misaligned. The owner said he had sprayed it with "contact cleaner", but didn't remember the brand. There was an oily residue ALL OVER the switch area, including the chassis, all parts, etc. A real mess that ended up as a parts unit.

Hey George.

I'm beginning to get rushed now. It seems all my gear is going down at the same time. I'm down to just one of my TR-4's. Even my Kenwood twins have a problem with the transmitter.

Let me know the soonest you could make some kind of deal on a T-4XC.

I've got me a new re-production front panel on the way for the L-4B as we speak. That's the only Drake that I have that is working as if should. LOL

497. R-4B bandswitch query

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-10-24 18:05:01 UTC
From: phbjr@aol.com
Topic: 497 Message: 497

Does anyone know of a source for bandswitch sections for the R-4B receiver? I have a really, really nice R-4B that is almost pristine cosmetically and works fine *BUT* I noticed that the upper spring finger on one fixed contact of one of the bandswitch sections is broken off. The rotary wiper seems to make a solid electrical connection with the remaining lower finger (i.e., the receiver works on that band) but I worry that over time it might become an issue.

It looks to me like it would be fairly straightforward to disconnect the wires connected to that switch section, extract the shaft, remove the damaged section, install a new one as the shaft is reinserted and reconnect the wires. But I need a new switch section first. Alternatively, I might be able to do some kind of micro-surgery on the old switch section after removal and replace the damaged fixed contact with one the same size, "borrowed" from another switch (I have several laying around in the junkbox) but replacement of the switch section seems a better option, if possible.

Thanks in advance for any tips, advice or sources.

Paul, K4MSG

Hi Gary,

It's the 3rd one back from the front, which I assume is C (as in
A-B-C-D-etc.).

Sorry, don't know John Kriner, I'm brand new to the list.

My niece lives in Glen Allen over off of Nuckols Road north of I-295.
I'm from Richmond originally.

73,

Paul, K4MSG

From: Garey Barrell
Topic: 497 Message: 500

Well of course that's one I don't have. Looking at the schematics it
LOOKS like wafers C and D of the R-4B are identical, and that the D and
E wafers of the R-4C might be the same as well.

Check with John,

<jkriner@...>

He has most of the "left-over" parts from the 4 and 7 series.

I'm not far from Nuckols South of I-295 off Lexington Farm Rd, which I
think used to be Ft McHenry Pkwy.

We lived in Charlottesville in the 70's before moving to Atlanta.

I am not sure of a regular supplier, hopefully another on the list will know of one. Have you checked on e-bay yet?
I have found a wide variety of caps available, but you are of course taking a chance.
Also, have you considered replacing with modern equivelants?
Don

PS. If anyone on the list knows of any parts suppliers or such, please feel free to post the links on the home page links section as well as here on the reflector. Thanks !

Kevin:

If you're going to replace one cap, I suggest replacing them all. It's also best to replace the diodes and bleeder resistors. The Heathkit Shop (http://www.theheathkitshop.com/) makes a replacement PS board for the L4/L7 which replaces all the caps, diodes and bleeders. I just assembled and installed 2 of them last week. Piece of cake.

Just for your information, Mike Bryce at the "Heathkit Shop" builds a very good circuit board with all new caps, diodes, and bleeders. The instructions to install it are very easy to understand, and there is only one circuit board when you are finished. I've done two of the L-4PS supplies, and the regulation is quite a bit better. Just do a Google search for it, and see what you think. The cost is reasonable.
I have no commercial interest in his business, just a satisfied customer.

508. Help...

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-10-30 20:15:13 UTC
From: Steve Matda
Topic: 508 Message: 508

Hi gang.

I've got a TR-4C here (SN 38xxx) with a few bugs and could use some help. Was running it on 80 meter SSB a couple of weeks back and noticed all of the sudden the plate current was stuck at about .15 amps...just a little bit above bias with about 10 watts output. Trying to adjust the plate/load control had no effect either while trying to tune. Then there was an HV flashover back in the RF cage. I turned the rig off a couple of minutes and turned it back on. Everything seemed to work normal. Later took the covers off and everything appears intact...nothing burned or even discolored. In fact it's a very clean rig
inside.

It has gotten progressively more erratic since then. Now I generally have no power below 3900 kcs--on 3950 I have 190 watts however, slowly dropping as I go down the band to the same old 10 watts out at .15 amps. Last night I cleaned the bandswitch hoping that would help, but it didn't. I have good output on 15, sporadic on 20 depending on where you are, and generally good on 40.

I know for a fact that the 9.0 Mhz oscillator crystal is erratic and needs to be replaced (the
sidebands will spontaneously shift around--usually a gentle tap on the back right of the case solves the problem). I also know that when the transmitter is acting up, I can still hear the driver output on frequency by using an another receiver.

I'm beginning to think I'm looking in the wrong place...maybe the problem is in the power supply. Any ideas?

Steve, KE4MOB

They no longer have the power supply filter capacitor replacement PCB for the 4-series receivers, either - darn! I need one for my R-4B. But I **QUICKLY* ordered the other parts I need or may need to keep things going.

Guess I'll have to "roll my own" clone of the cap board in my R-4A in order to upgrade the R-4B.

Maybe I should get hot and order the rebuild kit for my AC-4 before someone else goes out of business......;

From: Garey Barrell
Topic: 514 Message: 515

Kevin -

You could, but it wouldn't do much good. A 250V cartridge fuse (3AG?) will most likely not clear at the ~ 2000-2500V B+ of the L-4B. A "proper" fuse for that voltage is about six inches long, and they cost several ($4+) when you can find them. Collins used one in the KWS-1. The problem with the little fuse is that the power available vaporizes the internal element rather than just melting it, and the vapor is conductive enough to continue to conduct.

The $1 0.82 ohm _wirewound - flameproof_ resistor that Drake used works just about as well "almost" every time. It just vaporizes. Someone on the Drakelist was offering them a year or so ago, but I don't recall who it was.

I suspect you'd be better off to use a 1 ohm wirewound flameproof resistor or other value that is available.

There is another school of thought that says the resistor should be much bigger, both in value and power, and just limit the current under short-circuit conditions low enough and long enough to blow the primary fuse. I kinda like the idea of opening up as quickly as possible to protect the power transformer and other much more expensive items.

519. Re: [DrakeRadio] Re: Cable question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-11-09 21:37:41 UTC
From: Garey Barrell
Topic: 517 Message: 519

All original cables were 38" long tip-to-tip.

The INJ cable used a foam inner dielectric and phono connectors with a white insulation. This cable measures 60 pF total capacity.

All other cables used the standard for the day clear polyethelene inner dielectric and phenolic (brown) insulated phono connectors and measures ~100 pF.

Original Drake INJ Cable = 19 pF/ft TOTAL, including connectors = .160" o.d. (foam poly)

RG-62 = 93R = 13.5 pF/ft = 0.240" o.d.
RG-59 = 75R = 14.8 pF/ft = 0.242" o.d.
RG-6 = 75R = 16.2 pF/ft = 0.270" o.d.
RG-174= 50R = 30.8 pF/ft = 0.110" o.d.
Mic Cable (Belden 8410) = Hi-Z = 33 pf/ft = 0.160" o.d. (foam poly)
Mic Cable (Belden 8421) = Hi-Z = 16 pf/ft = 0.180" o.d. (foam poly)
R/S Audio Patch Cable = 28 pF/ft = 0.165" o.d. (poly)

The best choice is the Belden 8421 Audio cable from their "Brilliance" line. It looks just like the other cables, and is very flexible. The RG-62 is OK, but it is 50% larger and far less flexible. RG-62 is also prone to shorting if bent over too small a radius, and is susceptible to heat damage when soldering connectors. The best "feature" of RG-62 is that it is often FREE, since there have been many miles of it pulled out of old computer networks. Belden 8421 is available by the foot from ACK Electronics in Atlanta. Other distributors have it as well, although many require purchase of a full spool.

The only pertinent factor is the total capacity, impedance and "loss" are not important.

Any _reasonably low capacity_ coax will work if the units are cabled together for the adjustment of the INJ trimmers.

The cable type ONLY affects the LEVEL of the PreMix signal, (5.645 MHz ABOVE the transmit/receive frequency,) and a small DC control voltage between the two. If the shunt capacity is too high, insufficient LO level for the first mixer will reduce the sensitivity of the receiver and the output power of the transmitter. The C-Line has one additional "critical" cable, the CAR. OSC, that also requires the low capacity cable for best operation.

Date: 2007-11-11 00:58:22 UTC
From: Steve Finch
Topic: 521 Message: 522

I don□t have any easy way to replace it, but I have replaced the bulb with a high intensity LED. It simple, just put in a resistor to set the proper voltage (based on current draw of the LED) and it should be the end of having to open up the rig to replace that bulb.

524. Drake TR-3 No Ouput on Transmit

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-11-11 22:50:14 UTC
From: Jeff
Topic: 524 Message: 524

Hi All,

I got a question on the 12JB6 finals for Grids 1 & 2.

In receive all pins check check out except for Grid 1 pins 1 & 6 both measure about -74vdc

The receiver works just fine.

I set the bias and checked out the tranmitter and no output at all.

I verified that the transmit cathodes are going to ground and all voltages check out on the finals except for the grid voltage for grids 1 & 2. Grid 1 & 2 both still measures same as receive (-74vdc) and Grid 2 measures 241 vdc on pins 1 & 7.

any ideas

527. Plate meter needed L-4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-11-24 12:32:38 UTC
From: Mike-K5VSE
Topic: 527 Message: 527

I am in need of a plate meter for the Drake L-4B amp. I believe the L-4 is the same meter. From time to time I have seen parts listed for sale on the various lists and am hopeful that someone might have one from a broken amp. Any help greatly appreciated. Please answer direct to my email, as I don't check all the lists very often.

Thanks to all es 73,
Mike/K5VSE

528. 9 MHz Oscillator won't quite adjust

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-11-24 12:44:15 UTC
From: w5su_tx
Topic: 528 Message: 528

On my TR-4 I can't quite get the pitch of the hiss to equalize on both sidebands using C130. I get decent output and good signal reports on the "non-X" position, but output is down some, and I sound "tinny" in the "X-position". If the crystal were bad, would I even put out ANY signal in that position? Is there some other component in that circuit I should suspect? I've got a T4X-B on the shelf that I suppose I could borrow a crystal from for troubleshooting...does it use the same ones? (I'm too lazy to walk across the room right now and check its manual!).

Many thanks for info.

530. 2B crystals

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-11-25 04:02:27 UTC
From: Randy
Topic: 530 Message: 530

Does anyone know where I can obtain crystals for my 2B? I'm actually looking to get a couple of SW Broadcast band crystals. Probably 49m and 19m. Anyway, if anyone knows of a source, I'd appreciate hearing from you.

Thanks and 73's

Randy

Actually, the older Xtal controlled CB sets from the 60-70s work. I pulled a channel 13 rock from an old CB rig and got 49 meters, if I remember correctly.

Jan Crystals in Ft. Meyers, FL, will grind what ever you need. Not sure about today's prices, but they do good work and I have used them recently for military radios with excellent results.

Just Google Jan Crystals and you'll get the website.

Carl -

It's quite possible you have a bad filter. What is the serial number of the unit?

There are two filters, set to either side of 9.000 MHz. If you think of them as a letter "M". the carrier should sit in the trough in the middle, and the appropriate audio frequencies will be passed by either filter. If the carrier osc is displaced up one side of the trough, that side will emphasize bass frequencies and clip off high frequencies. The other side will emphasize the highs and clip off the bass. Consequently, if one filter has a bad crystal, resulting in a narrower point at the top of the M, one side will be good and the other will clip either the highs or lows, or even have a "hole" in the middle, resulting in distortion.

Since setting the carrier osc frequency "by ear" relies on equal integrated b/w on BOTH filters, if one filter has a distorted passband you will be unable to find a spot where the noise will sound the same.

You can check the filters in receive. Simply turn on the calibrator and tune slowly through the beat note while watching the S-Meter. As you approach the calibrator signal on the dial, you will hear either a high or very low note, depending upon which way you are tuning and which filter is selected. Regardless, you will first hear the signal at a very low S-meter reading, and as you continue tuning the same direction, the meter should increase sharply but smoothly to a peak, then remain at the same approximate level for about 2.3 kHz on the dial, and then drop off sharply but smoothly. The peak level should occur with an audio tone of approximately 300 Hz and then drop off when an audio tone of ~ 2.5 kHz is reached. If the drop-off occurs before you tune ~ 2.3 kHz, or if there is a significant drop within that 2.3 kHz range, you have a bad filter. If this filter looks ok, then switch the SIDEBAND switch to the other sideband and repeat.

The carrier crystal and filters in the T-4X series are at a different frequency and cannot be substituted for the ones in the TR-4.

534. Re: [DrakeRadio] Re: T4XB no transmit problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-11-29 20:15:51 UTC
From: Ryan Pigg
Topic: 491 Message: 534

Hi Group,

I'm back at it again with this xmtr and I can get 100W on 80m with no problem, 0W on 40, about 50W on 20m, 10W on 15 and 10m.

Garey, many thanks for your advice on the switches - never thought the cores could swell up and that could happen by soaking them with cleaner. I looked at the switch, and it looks OK, I used R5 spray, and a small eraser to clean the oxidation off. I also pulled the balanced mod and it appear to be OK.

So last night I decided to verify that the drivers and finals are OK, and basically they are. With 10dBm of drive at the grid (before the 15 ohm resistor) of the 12BY7, I get 100W ouput on the bands. (I did not get around to check 10 yet) I did notice the plate control was touchy at the higher freqeuncies though. Also, I did notice that alot of the trimmer caps (toward rear - driver ckt) were in need of alignment. The power came up when these were aligned for peak power. It appears as if someone has twisted caps around in this unit.

Moving to the premixer circuit on the 40 m band, I have the 18.1MHz and the VFO signal. I injected a 18.1MHz - vfo freq and cameup with 12.6 (approx) MHz. I injected this signal at the plate of the premixer tube (I pulled the tube out) I tried to trace the signal through, peaked the 'front' trimmer caps for the 40m band, but nothing. I injected the signal near the Mixer tube but still had no output. Maybe a switch, cap, one of those can xfmr's?? I also noticed a coil with a single turn of wire around it, this appears where the signal is picked off and fed to the mixer tube. Any idea's as to what the amplitude should be at this point?

I plan to get at again in the next few days. Also does anyone have the 'advanced align procedure' mentioned in the manual? The manual only has a 'rough' alignment procedure and says to contact the factory for complete alignment instructions.

Thanks and I hope everyone had a great Thanksgiving.
Regards, Ryan, N7QJ

Garey Barrell <k4oah@...> wrote:

OK. There have been a few reports of trouble with T-14. The four
diodes of the Balanced Modulator are INSIDE T14, pretty tightly packed,
and can short against the can, which is not good! :-)

The originals are germanium, usually 1N541, a few 1N270. Best to
replace them, IF necessary, with 1N5711 or similar Schottky diodes.

CAIG DeoxIT, D100L if you can find it, if not D5 sprayed into the cap
and put directly on contacts with a syringe or pipette, will resolve
most switch problems. Some claim that with some spray "cleaners" will
cause the phenolic wafers to swell. I have seen ONE case where the

phenolic wafers were distorted enough that the contacts were
misaligned. The owner said he had sprayed it with "contact cleaner",
but didn't remember the brand. There was an oily residue ALL OVER the
switch area, including the chassis, all parts, etc. A real mess that
ended up as a parts unit.

Ryan -

OK, you have eliminated some possibilities. Have you checked the Final neutralization? This can cause some squirrelly tuning of the Plate control.

The two rearmost trimmers are the Grid and Plate of the 12BY7 Driver stage. Be careful to not short the trimmer to the chassis while adjusting! Hard on a little half watt resistor that gets connected directly across the +250 VDC supply. Not good!

Here are some levels in the T-4XC which should be similar.

Carrier Oscillator (Arm of Carr Bal Pot) - 4.2V p-p

PTO (Coax at Switch) - 2V p-p Sine Wave

Band Oscillator (Collector of Q-7) - 1.5V p-p

V-8 Plate (Pin 7) - 3V p-p Complex Waveform (Xtal Osc & PTO)

T-2 Secondary (GAIN just below saturation)
Tune 3V p-p DSB
CW 2V p-p Carrier

T-3 Secondary (Tune)
Top (C27) 2 V p-p Carrier Oscillator
Bottom (R32) 3.3V p-p Premixer Output

V-4 Grid (Pin 2) (Tune)
6V p-p (GAIN just below saturation)

According to Bill Frost, the "Advanced Alignment Procedure" never existed. The procedure in the manual is all you need, especially if you have a scope and/or counter to make sure you're peaking the "right" frequency! Unless someone has been "fixing" it before you, the panel meter is all you really need to complete an alignment.

536. Trim Ring

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-12-02 21:54:52 UTC
From: wintersolem
Topic: 536 Message: 536

There used to be a trim ring available for TR-3, T-4X, and R-4A series equipment that indicated the sideband offset frequency. It looked like a ring that wasn't quite complete, but ended in a pair of prongs that indicated the offset. I had one on my TR-3 and am looking for another. Does anyone know of a source for these rings?

Thanks!

538. Drake group newbie!

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-12-02 23:19:28 UTC
From: Richard Arland, W3OSS
Topic: 538 Message: 538

Hello to the group. I have been a member for a few weeks but don't remember actually introducing myself.

I was first licensed as KN7YHA in June of 1963 while a junior in high school. Currently hold an Amateur Extra license that required 20WPM at the time. Do a lot of CW operation, QRP DXing, contesting, and really enjoy the hobby. Born and raised in the "Palouse Empire", a farming region in eastern Washington (state) just south of Spokane. Grew up with Drake, Collins, EF Johnson, Dow Key relays, Multi-Eimac, etc. All of which were way over my high school budget.

Spent 20 years in the USAF Comm Command, traveled all over the world, licensed as CT2BH (Azores), G5CSU (UK), DA2NE (W. Germany), KA2AA (Japan).

Spent 17 years as a VoEd electronics instructor for the Pennsylvania Dept of Corrections. Retired from that job 2 years ago and am now fully retired, which, when properly translated means I am the full time babysitter for 7 grand kids!

Over the years I have written countless articles for the radio hobby press: QST, CQ, CQ-VHF, Pop Comm, Monitoring Times, National Communications, to name a few. From 2000 to 2004 I was the first (and only, so far) QRP column editor for QST magazine.

Authored six books, the last three for the ARRL on QRP.

I enjoy sunsets, long walks on the beach, kittens, handguns that begin with a "4" as the first number of the caliber, camping, and photography.

My boatanchor restoring days are about over. Not enough room. I currently have an absolutely mint TR-4Cw (RIT), with matching PSU, W-4 wattmeter, and speaker. I would like to get the RV-4C, and matching console to round out the entire station.

My other "ham radio vice" is MilCom gear. Love the green gear. My pride and joy is a TM/TO complete AN/PRC-64 Special Ops/spy rig that has a massive 5W output on CW and 1.5W output on AM. My other prize is a fully restored AN/PRC-74B with matching PSU/charger that is in daily use at W3OSS.

Welcome to the group ! Sounds like you tend to keep busy !
Please feel free to upload you station pics, or any Drake related files or links, to the groups homepage. And if you have not allready done so, please check the links section of the homepage for some of the more established e-mail reflectors and websites. This group was started due to the owner of the previous Drake yahoo group left and the list was taken over by spam.
And please do not be shy in asking or answering questions here. Again welcome to th group!
Don

Subject: [DrakeRadio] Drake group newbie!

Hello to the group. I have been a member for a few weeks but don't remember actually introducing myself.

I was first licensed as KN7YHA in June of 1963 while a junior in high school. Currently hold an Amateur Extra license that required 20WPM at the time. Do a lot of CW operation, QRP DXing, contesting, and really enjoy the hobby. Born and raised in the "Palouse Empire", a farming region in eastern Washington (state) just south of Spokane. Grew up with Drake, Collins, EF Johnson, Dow Key relays, Multi-Eimac, etc. All of which were way over my high school budget.

Spent 20 years in the USAF Comm Command, traveled all over the world, licensed as CT2BH (Azores), G5CSU (UK), DA2NE (W. Germany), KA2AA (Japan).

Spent 17 years as a VoEd electronics instructor for the Pennsylvania Dept of Corrections. Retired from that job 2 years ago and am now fully retired, which, when properly translated means I am the full time babysitter for 7 grand kids!

Over the years I have written countless articles for the radio hobby press: QST, CQ, CQ-VHF, Pop Comm, Monitoring Times, National Communications, to name a few. From 2000 to 2004 I was the first (and only, so far) QRP column editor for QST magazine.

Authored six books, the last three for the ARRL on QRP.

I enjoy sunsets, long walks on the beach, kittens, handguns that begin with a "4" as the first number of the caliber, camping, and photography.

My boatanchor restoring days are about over. Not enough room. I currently have an absolutely mint TR-4Cw (RIT), with matching PSU, W-4 wattmeter, and

speaker. I would like to get the RV-4C, and matching console to round out the entire station.

My other "ham radio vice" is MilCom gear. Love the green gear. My pride and joy is a TM/TO complete AN/PRC-64 Special Ops/spy rig that has a massive 5W output on CW and 1.5W output on AM. My other prize is a fully restored AN/PRC-74B with matching PSU/charger that is in daily use at W3OSS.

Thanks, Don.

In checking out my TR-4Cw, I noticed that about all I could get for RF out was around 40W. The Ip says around 300mA. It loads fine, but the output is low.

Methinks that I have some soft finals. Any place in particular that the "Drake Dudes" go when they need three PA tubes??

Rich -

Those numbers would indicate that you are leaving 155W in the 6JB6 final plates. Unlikely unless they are cherry red!

You might want to check the condition of the meter shunt resistor.

Hello, not sure if I can help much, but do remember that the older version of the TR-4 had a "soup can" type enclosure for the 4 pole crystal filters on the under side...the newer version used the more familiar 2 individual 8 pole crystal filters...also..the 6BZ6 is a "hotter" RF tube than the 12BA6 and I think it came out later as well....so my guess is you got a newer version of the TR-4, but check the selectivity filters on the under side right in the middle front of the radio..to be sure..

Hi Garey:

Thanks for the info. Let me fire that rig up again, put the URM-120 and cantenna on it and get some new data. If you don't mind, I will contact you off-list with the new data and maybe find out what is wrong with this outstandingly beautiful set. I really would like to have this rig up and running 100% this winter.

Serge -

There were 12 versions of the TR-4/C transceiver.

Yours is what I call version 5, which was the second of the TR-4B models. This version has the twin eight-pole filters, the FET PTO, the neon indicator behind the Main Tuning knob and is the first to have the top cover over the PA cage. The correct schematic is 466827500. The tube in V11 was changed from a 12BA6 to a 6BZ6 to increase the IF gain to compensate for the increased loss in the eight-pole filters over the earlier four-pole units. V5 was changed to a 6BA6 briefly, then to a 6BZ6 at the same time to make the series/parallel filament string work out right!

There were some passive component changes as well as a part of these changes, plus some other minor tweaks.

I have the correct schematic in my Service Supplement CD for the TR-4C, which I hope will be available shortly. If your email can accept a 6 MB attachment I can email a high quality image of the schematic that will print out at either 8.5 x 14" Legal size or 11" x 17" or larger if you have access to a big printer. It will also print at 24" x 48" if you want a wall size.

Let me know what you find out. The meter shunt resistor is a 2 ohm,
1/2W carbon, and they do go up in value, resulting in "optimistic" plate
current readings!

thank for all replies , now i know !!! (in french we say 'jeu de
mot ') i have download a pdf with the two 6bz6 instead of 12ba6 ,
so i think i can use it... in fact it's very interesting for the
quartz filters !!!! best 73 Serge.

553. Drake R4-A restoration

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-12-21 06:29:40 UTC
From: Alexandre Mater
Topic: 553 Message: 553

Colleagues,

I am working on the restoration of a receiver Drake R-4A and I´m having some problems, among them that it is difficult solution:

When I turn on the receiver, the S-meter scales up and the sensitivity is minimal.

After some time, I find the following situation: with the RF gain at minimum, the S-Meter indicates +40 dB and with the RF gain at maximum, under 0dB.

I measured some tension on the lines of AVC1 and AVC2 as below.

Any help will be very appreciated.

Regards,

Alexandre Mater
PU5-ALE

RF Gain AVC1 (volts) AVC2 (volts)
AVC Off Maximum -0,59 -0,58
Minimum -14,76 -14,75
Fast AVC Maximum -0,38 -0,48
Minimum -3,8 -4,65
Slow AVC Maximum -0,4 -0,48
Minimum -4,6 -4,64
AM Maximum -0,48 -0,48
Minimum -4,6 -4,64

From: Randy
Topic: 554 Message: 554

Here are a couple of questions I've been asking on various groups and email lists. As a new amateur (lets assume General Class), what would your recommend for a first rig for HF phone? Is a transceiver the best option? I already have two receivers, a Kenwood R-5000 and a Drake 2-B. What transmitter would you mate to those receivers, or wouldn't you recommend doing that as a first rig? I'm interested in any and all opinions. Since I do not have a endless source of capital, consider cost when you make suggestions. Thanks for all your help.

73,
Randy

I generally don't recommend older tube gear as a first rig. Not that it can't do the job for you, but if you don't have the technical knowledge and some basic test equipment to service it yourself, you may run up some hefty service and shipping charges in getting it fixed. Part of the advantage of the old gear is that it CAN be worked on at home by a reasonably technical ham with some basic test gear. I've bought and sold a lot of used gear over the years, and in recent years have found that 100% of the units I've bought, whether from an individual in person or over the Internet, have had at least one problem that I had to fix. The other problem is that the boatanchor prices have just gotten all out of proportion to the equipment's true value. For collector-quality appearance, maybe that can be justified, but it's hard to see why anyone would pay the steep prices for something with rust inside and out! Just so as to not seem too discouraging, any of the old Drake R4/T4X lines would be a good choice and the performance would far exceed most of the stuff that's 4 times the size and twice the price. They generally are stable compared to other stuff of their era and are readily fixable.

Well, I can only really think of two "modern" HF radios that I would recommend for the beginner, and that's the Icom 718 and Yaesu 840 (and I'm a Kenwood man myself, if that tells you anything). Simple and bulletproof.

Going back 15 or so years...I have used a Kenwood 450 since I became a ham, and can recommend it. 30 years...the Kenwood 430..or the Drake TR-7. The TR-7 is looking to hold its value very well, as eBay usually has them for around $500 including the PS-7. Not bad for a 30 year old rig.

40 years...I've got a Drake TR-4C that is just a blast to use on SSB. (On AM I use the TS-450 as an exciter for a dual 4-400A amp and a Drake R-8 as a receiver...that Drake super-wide passband tuning and Synchronous Detection is the cat's meow for AM work.)

As for modern rigs...I tend to find all the menu driven features...annoying. I've used a Icom 706 and 746 and Yaesu 857, and can honestly say that I NEEDED the manual to operate, and spent more time diddling with the settings than I did actually operating. It's pretty bad when you have to consult the manual to figure out how to change the mic gain!!

All that said...with 13 years under my belt my NEXT radio will either be a Kenwood 850 or a Drake TR7.

Hope this helps..

New to ham radio and looking for a cheap easy radio. Kenwood TS-120 or TS-130. Cant work split but that can come later. Have had 4 of them over 30 years and they are great. never had the first problem with any of them. Did have one more that was a 130 but it was broken when i got it and I got it for possible repair. Still have it and its still broke. John

558. How To....?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-12-23 15:24:38 UTC
From: Sprint
Topic: 558 Message: 558

I just acquired an R4B. The copper chassis has big blotches of discoloration.

What is the secret of returning the chassis back to a nice shiny condition without removing/damaging the tube nomenclature?

Thanks in advance!

Joe Wolfe

559. TR-4C resurrection

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-12-24 06:49:27 UTC
From: Paul
Topic: 559 Message: 559

I am in the process of installing an AC-4R power supply board into my AC-4 supply.Wonder if anyone has had any problems or tips on this board??

In the same vein I have a TR-4C/RV-4C/MS-4 that I want to put back on the air.My dad (KW5T)and I got it new back 1972 from Henry Radio and it has been a great radio with minimal problems.After several years of non use I felt it was time to bring it back to life and enjoy it again.

My question is this: My dad was a heavy smoker and the inside of the radio has that brown nicotine coating.The front and cabinet cleaned up pretty good with 409 and a paper towel.Is there anything I can use that will remove the nicotine from the underside without harming the components, especially coil forms and plastics?I know there is at least one intermittent tube socket and I am contemplating using De-Ox-It on the tube sockets and all switches and controls. I hope that will minimize or eliminate the intermittents.I'm sure the nicotine hasn't helped it any.Some of the tubes are microphonic if I remember correctly so I will be having to replace them.I would like to eventually have a full spare set of tubes including the finals for the radio.

Is there a source for the PM-12 (or #12??) antenna fuse lamps?At one time Mouser carried them but I have not checked the internet for another source for them.

I also am concerned about the multisection electrolytic in the radio.I may either need to replace it with several individual ones assembled onto a small PCB.Any suggestions?What about the tubular caps in the radio?Should they be swapped out as well??

I don't have access to a variac when I power the radio up for the first time but the last time the radio was powered up (2002) it was working just fine though the output was intermittent, probably from non use.An extensive "burn-in" is planned for the radio.

Anyone have a recommendation for a microphone for the radio?I have one that I use with my TS-520S but I'd like to have one dedicated for use with the TR-4C.Originally an Elctro Voice "banana" microphone was used but it went out while my dad had the radio.

Thanks for your help and I look forward to your input.

Paul WB0CJB

Paul,

The only part of your message I can respond to will throw you fora loop at first. As far as cleaning the unit take out the tubes, then run it through a dishwasher. That is right, a dishwasher. I had done that with several old Motorola tube type units, and some Heathkit HW 18s. Just make sure that EVERYTHING is 100% dried out before applying power after.

Now, the caveat that I will add is that at the time I did this we were talking maybe 1960s vintage radios going through the dishwasher in the 1970s. Today there may be more concern with drying out caps, etc. We are still talking 1960s vintage radios, but now instead of ten years later, we are talking forty years later.

One other thing. As far as that awful tobacco smell goes, if you have small enough parts put them in a plastic bag with a dryer sheet for a few days, it will take the tobacco smell away. Of course it does nothing for the looks.

From: w5rkl
Topic: 559 Message: 561

A dishwasher cleaning of a TR4C, in my opinion, is not a good idea. There are too many can transformers plus the PTO that could become damaged. Of course, that's my opinion only.

As for the bulb fuse, you can try

www.1000bulbs.com

or

www.bulbdirect.com

The bulb is a 6.3vac 150ma bulb. If you can find a similiar bulb, it should work just fine.

As for nicotine under the chassis, you can use Deoxit on the switches but use it sparingly as Deoxit is quite flammable. Make sure you wait the required time, as stated on the can, before powering up the radio. I also suggest using canned air to blow out dust and dirt in the final cage especially in the PLATE and LOAD variable capacitors. The LOAD capacitor has plates that are much closer together so you will have to ensure the dust doesn't become lodged between the plates.

The top of the chassis can be cleaned with 409 and a tooth brush. A soft brush, one for a child, can clean up the chassis quite nicely. Have a couple of them. Heat one at the base of the brush just enough to bend the brush at a 90 degree angle. Let is cool and you'll have a brush that can be used in areas where a straight line brush handle won't fit.

Cotton swabs are also good to get into corners or along the edge of transformer cans and other areas where a brush won't fit.

Do not clean the PTO plastic gear with anything but very mild soap and water. Use of any solvents can permanently damage the plastic gear, causes them to swell. If the PTO gears are quite dirty, you will have to remove them and clean not only the outside surfaces but also the gear shaft races. A cotton swap with mild soap and water can get rid of the grease. When reassembling the gearing system, do not use petroleum based lubricant. These lubricants can damage the gears.

The link below can give you an idea of what to do and how to do it when cleaning the Drake plastic gearing system. The link shows the R4C PTO but it applies to all Drake PTO plastic gearing systems. You should look the PTO wiring over and draw the circuit on a

piece of paper with wire colors noted and where they go before removing the wiring and ultimately the PTO. I've done this with a TR4C I use to own that had a very stiff PTO gearing system. Once I completed the cleaning, the PTO tuned very smooth.

http://www.wb4hfn.com/DRAKE/DrakeArticles/PTO/Drake_PTO.htm

As for the AC-4R replacement board, it's pretty much self explanatory. Mike has put together a very nice PS board and if you follow the instruction to the letter, you should have no problem what so ever. Just make sure you check the wiring when you are finished. A wire in the wrong place can cause you some real problems or the TR4C won't work at all. The biggest problem with any of the AC3 and AC4 power supplies are the electrolytic capacitors. They are no longer available, the black outer covering over the metal capacitor. However, you can buy new modern low profile capacitors to replace the original ones. If you have noticed, Mike's board did just that except he included a PC board with all the components mounted on the PC board with very little, if any, components under the chassis. This is a good thing. I have an original AC4 that I have not yet installed Mike's board, it's still working very well with my T4XC. By the way, the AC-3 will also work with any TR3/4 or T4 series transceiver or transmitter. They're both the same and have the same voltage and Jones plug connections. Here's a link that shows pictures of the supply board.

http://www.wb4hfn.com/DRAKE/DrakeArticles/AC4-Upgrade/AC4_Upgrade.htm

If you have not yet done so, I highly recommend adding a cooling fan on the rear of the final cage. The finals get quite warm after normal sideband and CW transmissions. A small 12VDC cooling fan, usually available from Radio Shack, can be easily installed on the rear of the final cage without drilling any holes. Power can be obtained from an external 12VDC source OR from the TR4's filament supply through a half wave rectifier circuit. The power drawn from the filament supply to power the fan is not enough to be concerned about. I've been using my T4XC with this cooling arrangement now for 7 years and it really keeps the finals cool. The electrolytic capacitor used in the half wave rectifier determines the fans speed. I use an 8ufd at 25VDC and the fan turns at 75% speed with every little fan noise. A much larger capacitor, 10ufd or higher, will increase the speed of the fan and also increase the fan noise. I do not recommend using one of those computer CPU fans. They are too small and do not provide sufficient air flow. Some people say blowing air into the final cage causes it to become dirty a lot faster than if you draw air from the final cage. I find that it really doesn't matter since the final cage will need cleaning at least every 6 months anyway so why worry about blow into or drawing air from the final cage.

In closing, here's a link to a website that has quite a bit of Drake
information that may help in your restoration of your TR4C. You
will notice the links I provided earlier are also available at
this website.

http://www.wb4hfn.com/DRAKE/DrakePageHome.htm

Good luck and Happy Holidays.

See this link: http://www.dproducts.be/drake_museum/q.htm

Q-Multipliers were quite common in the late 1950s, but I never saw
this one before. Everyone I know used the Heathkit model. Same
principle as the Q Multiplier sold for the Drake 2B in the 1960s.

566. TR-4C resurrection

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2007-12-26 23:21:53 UTC
From: Paul
Topic: 559 Message: 566

The power supply board is in and the rig has come to life once again.All tubes check fine and the receiver is doing good with the exception of an intermittent bandswitch.I can get RF output on 40, 20, 15, but none on 80 and 10.The 80 meter receive is flaky (intermittent) and no RF output on 80.I did spray the switches with a cleaner (NOT WD-40) and that seemed to do the most good.The rotary switch wafers have a black coating on them (I assume its oxidation) and wonder if the De-Ox-It on them would do away with the intermittents.40 meters began showing output today so thats why I think more and more its a dirty bandswitch.I'm also thinking of going through and tightening the hardware throughout the radio.While tinkering with it last night I noticed the receive would cut in and out at times while tapping on the chassis.Any suggestions?The longer the radio is on the better it works...

I don't think putting the radio through a dishwasher would be a wise idea although I have heard of people doing that.I'm not going to worry about the nicotine as its not a big deal.As long as the radio is working fine then I'm leaving it alone.

If the WA9TFT website is no longer there anyone know when I can get a set of the blue "filters" for the dial and meter?When my dad had it he cleaned them and ended up wiping off most of the blue on them.I think he has the one for the dial in backwards as the dial is blue when the radio is turned off.Wonder if anyone has taken a high intensity blue LED and used it to illuminate the dial and meter???The color of the LED is probably not like the blue filters that originally came on the radio.

For being 35 years old it still sounds good!!!!!Bet you won't get that kind of use from today's SMT riceboxes.

I've got a R-4C receiver that I ordered and put blue LED's in leiu of the regular bulbs and it looks like a million dollar radio. I got the tip from a fellow that has them installed in his TR-4. I purchased mine at http://superbrightleds.com and as I recall they were just a few dollars a piece. There more blue than blue-green, but still look nice.

Paul,

Here's a website that may help you with your TR-4C restoration.

http://www.wb4hfn.com/DRAKE/DrakeTechTips.htm

There is a link on this page under the "Restoration Techniques"
section, that shows, with pictures, how to clean those wafer
switches. I've used it and it works very well.

I forgot to mention about the blue filters. I bought some
blue plastic binder separators and cut them to fit. I used
this method in a TR-3 and TR-4C I use to have. I also used
it with my T-4XC and R-4C dials and meters and it works very
well.

I recieved a new-to-me Palstar 1500cv for Christmas. So far, I really like it over my other tuners(dentron,nye, homebrew,ect.). And no, sad to say, I do not have a Drake tuner. It is made in the US, which is a Big plus as far as I'm concerned, and the quality seems pretty good.
Any one here using a palstar that can offer a comparison to the Drake tuners? or any comments on them and there use?
Thanks,
Don

572. A digital VFO for the TR7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-01-02 00:14:41 UTC
From: Floyd Sense
Topic: 572 Message: 572

While looking for a digital VFO that I could adapt to the TR7, I ran across one called the IQPro, designed by Craig Johnson (AA0ZZ) and sold as a kit by Kanga.US . Kanga is getting back in business after the disastrous flood of last August and will be selling the kits again soon.

Anyway, I was able to find a used IQPro and spent the past couple of weeks adapting it to use as an external VFO for the TR7. Results have been very good, and I can recommend it to anyone who's looking for a good technical project and a great VFO for the TR7.

In its supplied form, the IQPro can tune from 0 to 30 MHz, and adapting it for the TR7 involved modifying the PIC code to use the proper offset for each band so as to produce the correct 5 MHz output range while displaying the proper TR7 frequency on its LCD panel. The VFO has two separate VFOs and you can operate split or from either VFO when not in split mode. Power is taken from the RV7 connector on the rear of the TR7 and my documentation explains the other interface considerations.

If interested, take a look here - www.k8ac.net/DDSVFO.html . There's a link at the bottom of the page to a page of photos of my prototype. You may email me if you have any questions.

Hello all.
As a newy I'm straight in for a bit of info, please.
I have a T-4XC and a R-4C. They both work great except that in the separate position I get the expected 100w out but if I go into transceive mode the most I can squeeze out is 50w. Is this normal.
I have the original interconnecting wiring loom and note that the handbook states you have to be sure to use the lead marked low capacitance from the Rx Inj outlet to Tx. None of my leads are marked low capacitance.
I feel that somehow these two are related.
Any info appreciated.

Hi
Sorry to intrude again. Have just re-examined the connecting loom and under some insulation tape which had been used in places to tidy the loom I found a couple of metal tags eached marked INJ. One was in the carrier Osc line and the other in the Inj line. So it seems that the interconnecting has been correct.
Still left with the power problem.
Vic

I use RG-62 coax between my T4XC and my R4C
for all injection connections.

For the mute, anti-vox, and dial lighting, I use
simple stereo interconnecting cables. Antenna
connection between the T4XC and R4C I use RG-174
coax.

If you have the original cabling, I would replace
them.

BTW, do you have a cooling fan mounted on the rear of
your T4XC? If not, I highly recommend one. A simple
12VDC muffin fan powered by a half wave rectifier circuit
fed from the filament supply in the T4XC.

From: Garey Barrell
Topic: 576 Message: 579

Vic -

You have found the correct cables for INJ and CAR OSC.

You can try just peaking the INJ coils in the receiver and transmitter, but should do an alignment of the Antenna, RF and Injection in the R-4C, Section 5 - 12 of the manual, and the RF and Mixer Stages, Section 5-8 of the T-4XC manual, with the pair cabled together.

A full alignment of both wouldn't hurt, but the above will probably solve your problem. There will always be a slight difference in the Preselector or RF Tune settings between separate and transceive, but it should be minimal. The units were aligned individually at the factory because there was no way to know which Rx and Tx might be sold as a "pair", but aligning them while cabled together gives the best results.

581. TR-4C version

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-01-12 00:00:09 UTC
From: n0va1994
Topic: 581 Message: 581

For many years I have enjoyed listening to my collection of broadcast receivers from the 1920's-30's. The warm, rad glow of the tubes and the rich tone of the speakers coming from real wood cabinets is quite cheery. I decided to add another dimension of enjoyment to my ham radio hobby and so a TR-4C is now on its way to my house.

I've been searching the group posts, files, links and database for build information based on serial number but so far no luck. I did run across the following 12/2007 post by K4OAH:

"There were 12 versions of the TR-4/C transceiver. Yours is what I call version 5, which was the second of the TR-4B models. This version has the twin eight-pole filters..."

So apparently the information is out there. Would anyone be able to tell me what to expect from a stock TR-4C bearing S/N 40249? Seems there are versions with different components.

Well, the information is not quite "out there", yet. :-)

I've been working for quite a while on a Service Supplement CD for the TR-4/C series, which should be out very shortly. It's been quite a job, thanks in part to just how much is jammed into that box, and the 12 different versions over almost 13 years of production. The correct schematic for your unit would be 4077538800. The CD will have all twelve schematics.

Anyway, the unit you mention would be a Version 11, just about the last of the TR-4C model, and is the one the CD color photos are based on. The remaining 5,000 manufactured were almost all TR-4Cw and/or TR-4CwRIT versions.

There are two additional resistors in the "last" version, one of which is to accommodate the "new" TR relay, and about a dozen capacitors, the majority of which are inside the PTO to enable the RIT function. So really not any significant differences outside of the new CW and RIT features. The design was pretty much optimized by then! :-)

Garey: Thank you! That is the kind of information I was hoping would be available. Now, I do not know the good, the bad or the ugly of this version 11 TR4/C.

Using some serial number data run across last night my current best estimate of the mfg. date for this unit is sometime in late 1975 although the original owner from whom I purchased it said he bought it new about 1978. He also said this unit does not have the optional noise blanker installed. Is the noise blanker option something I should be trying to locate?

This group should be an interesting addition to enjoyment of these older tube-based Drake amateur radios.

Ken -

Essentially you have the best of the TR-4C series, short only of the CW filter and RIT features. The block diagram only had one minor change over all twelve versions, the addition of an audio preamp stage in version 7 in 1970. There were tube type changes, and circuit changes made to cover technology improvements over the years, but the basic design was just refined as they went along.

Your date estimate is correct. This is about the time the Cw version became available, which could have caused the basic version to sit on the dealers shelves for a while. Also "normal" people tend to be off a year or so in their estimates of when something happened 30 years ago! :-)

The noise blanker is a 34-PNB, and is very rare to find by itself. They sell for about $200 now, when found, but are mostly a "collectible" unless you intend to operate mobile or live near a highway. The blanker does an outstanding job on ignition noise, extremely short, high intensity pulses, but doesn't do much for power line noise. Only you can decide if it's worthwhile for you!

This is a good group, although the "drakelist" is more active. Found at <http://www.zerobeat.net/drakelist/>

Welcome to the group(s)!

Dave -

I have a new "aftermarket" knob that is almost identical to the R-4C knob. Actually it IS identical, except the hole for the spinner button is NOT drilled, (although the internal molding IS there,) and of course the bright insert is not notched for the spinner. Since you have the button and the bright, it would be a simple matter to pop out the old bright, drill the boss, and reassemble.

I think I paid about $7-8 for these some years ago, so that would be fine if you can't find an original.

By the way, the TR-7 knob "looks" identical, but it is not as thick, and so won't compress the rubber clutch on the C-Line units.

Hi
Here again - sorry to bore or burden you but Drakes are hard to come by in UK and spares even worse.
I'm looking for a couple of the rubber doughnuts that fit on the tuning shaft behind the knob and ali plate for calibration purposes.
Seems simple but getting hold of rubber piping to modify and replace the parts is nigh on impossible - everything is plastic these days.
Tried every hardware store in the locality but zilch - same result from scrapyards - everything is damned plastic.

Vic

Vic -

Most hardware stores carry polyethelene (clear plastic) tubing in many sizes. This will work pretty well. The original on the 4 LIne was a fairly hard gray rubber that hardened with age. Often this can be salvaged by sanding the ends to roughen them up. The 7 Line used rubber surgical tubing, (sort of a translucent amber color that becomes opaque with age, but retains its flexibility. Some have used rubber automotive fuel line tubing, (with the fabric reinforcement) which works OK.

It's really not all that critical, all it has to do is be very slightly compressible to act as a slip clutch between the back of the main tuning knob and the dial disk center hub. It only has to slip for adjustment, which shouldn't happen that often. Just about anything that is about 1/4" i.d. and about 1/2" o.d. will work just fine, as long as it is close to 1/2" long. Actually the id and od are not all that critical as the only friction needed is on the ends, so even a plastic tubing will work well if the ends are roughed up a little.

Try the link below:

http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/BushingRepair.htm

I repaired my R4C using this link and it works very well.

598. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-01-13 23:58:36 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 598

All group memebers are welcome to post here on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others (what you put into this group you will get back so participate if you have a chance). Although we would like to focus on Drake Radio subject matter any Ham Radio subject matter is allowed. This includes any QST's of events or hamfests, especially if Drake radios are included

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our groups home page, as well as links to Drake information or your homepage.
Thanks to all members for your particapation.

From: Jim Harris
Topic: 599 Message: 599

I just dug out my old Drake TR5 and have found that the transmitter output power is way low. I cannot find a manual for the radio and would like to repair it. I have been unable to find a copy of any kind of a manual on the Internet to download. I wonder if anyone on here would have something, even a schematic, or know where I can get anything for it in the way of a manual? More than happy to pay for photo copying and shipping. I would really like to repair this radio. Any help is appreciated.

Thanks,

73, Jim VE1RB

I have a TR7. The TR7 pre-dates the computer processor control rigs. Not having a central processor, in order to control frequency, you would have to build a complicated interface using the DR7 connections. I don't know of any other way to control frequency from a computer and I don't believe you would be satisfied with the limited benefit.

I recently adapted the IQPro DDS VFO for use with the TR7. The next thing I'm going to add to that is a PC interface using the Icom CIV protocol. It will simply plug into an Icom CIV port on whatever type of converter you're using. Sorry, but can't say when I might have that available. When it is, you'll still have to build the VFO, but the software for it will be free. The Woodbox radio people in Italy had offered a PC interface on the DDS VFO they were selling for the TR7, but that seems to have been discontinued some time ago.

HI
Got my Tx working on both separate and transceive with 100w out.
Not much help but I don't know how. Disconnected all the connecting leads, cleaned switches and valve pins and phono jacks and put it back together. Hey presto working as it should. At a guess I would say it was the separate/transceive switch contacts that were causing the problem - which doesn't make a lot of sense!
By the way, if anyone has a MS-4 speaker cabinet they want to part with I'd be pleased to here from you. Can pay via Paypal.

Congratulations on fixing the problem.

The TRANSCEIVE switch on the T4XC controls the injection signals
between the R4C and the T4XC. If corrosion has built up on the
TRANSCEIVE switch contacts and the RCA jacks, it stands to reason
the injection signals will be affected which will ultimately affect
the T4XC's output.

This is a common problem with vintage gear which if that's the
only problem, can usually be fixed by cleaning the contacts.

Having said that, alignment along with the interconnecting
cables can also play a role as well.

Again, congratulations on fixing the problem.

Hi Mike

Re speaker:

From a practical and shipping point of view I don't need the actual speaker - just the case.

How close is the repaint to the original Drake colours?

Re an offer - there you have me. I have never seen one for sale in UK so haven't a clue on pricing. If you could give me some idea including shipping it would help.

Cheers

Vic

616. TR-4C not for QRP is it

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-01-20 23:51:24 UTC
From: n0va1994
Topic: 616 Message: 616

Well, reading a PDF manual for my newly arrived TR-4C I see that it is possible to operate this transceiver like a "Novice" at 75W after a bias adjustment. Obviously that is not QRP.

I run all my other (solid state) stuff at low power. I think the most I've run since we moved to this house in 1995 is 60W out of my Ten Tec Model 544 Triton, and that was not for long. Usually run around 5 watts, more or less.

Is it a bad idea to stack the MS-4/AC-4 on top of the TR-4C? There's a lot of heat under that speaker cabinet. I did put a quiet 3" fan next to the PA cage. I haven't run a tube rig since my Galaxy 5 in 1979.

Ken - N0VA

617. Re: TR-4C not for QRP is it

Yahoo group: DrakeRadio (2006 — 2011)

From: w5rkl
Topic: 616 Message: 617

You should be able to run the TR4C at QRP output levels quite easily. If your TR4C's front panel GAIN control does not reduce the output down to nothing on CW then more than likely the carrier null needs to be adjusted. I ran into this with my T4XC on CW. After performing the carrier balance adjustment outlined in the manual the front panel GAIN control turned completely counter clockwise reduces output to zero.

A fan can be easily mounted on the rear of the final amplifier cage without drilling any additional holes. The fan can be powered by a simple half wave rectifier using a 22ufd 25vdc electrolytic capacitor and a 1N4001 diode. The 22ufd will run the fan at a faster speed to move more air for the 3 6BJ6's.

Just a few ideas I've used on my current and previously owned Drake gear.

The other day my MN-2000 refused to tune my 135 ft dipole. The tuner goes into a balun made of 25 ft of RG8 on a 5inch piece of PVC. Long story short. It turned out to be the 88uufd and the 100uufd loading caps. They were shot. Boy are those thing hard to remove. I noticed that they only had a 600V rating. The replacement caps I used have a 2500V rating.

Has anyone else had this problem? And did you use the same type of cap for a replacement are something more modern?

By the way, the complete station is a C-line and L-4.

Thanks in advance, John

Hi Floyd

Hells bells! Just looked at that link and took a deep breath when I saw the prices.

Guess I'll let things stay as they are.

Thanks for info.

Check out the info at this link: http://www.sherweng.com/ham.html

You can spend a ton of money on the Sherwood mods, but I've had them all
in the past and thought they were worth it.

Vic -

The Sherwood mods are very well thought out, engineered, and do a lot for the R-4C.

However..... Unless you are into low band contesting, (where you have ten 60 over S-9 signals at each kHz of the dial,) and you need to pick out an S-3 signal in the middle, you'll likely never hear the difference. For typical day-to-day operation on our relatively empty bands, they won't really do much for you. What they do very well is allow you to hear an S-3 signal between two 60 over 9 signals a couple of kHz apart.

The rest of the "improved" boards all address perceived problems, that most likely you are not even aware of and wouldn't notice unless someone pointed them out to you.

Replacing C100 with a 0.68 uF tantalum cap will mellow what some consider "hissy" audio, and costs a buck or two.

The Sherwood mods represent a LOT of money to invest in a 40 year old tube based receiver. If you NEED the signal slicing capability, it will rival just about anything on the market today, and beat quite a few. The Receiver Test Data chart on their site is very interesting, but it is designed to highlight the improvements provided by their products. If you discount the signal slicing capabilities (the two kHz spacing columns) the Stock R-4C moves up considerably.

Victor:

As stated before, the Sherwood mods do wonders to the performance of the R4C. I had all the mods performed (except the filter mod) on one of my R4C's and it made a world of difference. An R4C with all the Sherwood mods easily performs as good if not better than the current crop of radios. However, it comes at a price. If you were to send the R4C off to Sherwood to have the mods (includeding the filter mod) done, it would cost about $1,400USD! Not including freight. OUCH!

Thanks to all for wealth of info on conversion etc.
When I read through the Sherwood list of mods (and prices)the thought crossed my mind," how much of this would I really notice? "
Being 100% CW, not into contests and never below 40m I don't think there would be much perceivable difference.
I totally agree about the tuning rate but I think I can live with that.
I do like the idea of changing C100 to mellow the audoi hiss.
Thanks again.

Vic

First, the R4C is an excellent ham band receiver.

However, having said that, I believe there are some areas in
a stock R4C that need improvement. First, the original power
supply. With a stock R4C powered on for 30 minutes or more,
place your hand on the right rear side. The heat you feel
is coming from the original power supply and final audio
amplifier. The original R4C power supply and final audio
amplifier produce the majority of heat in a stock R4C.
The Sherwood power supply and final amplifier replacements
completely eliminate that heat. I also recommend
picking up the Sherwood power supply filter board. The original
capacitors are no longer available. For the purist, this may
not be a good thing as it requires removing both original
filter capacitors and mounting the board on top of the chassis
in the spot occupied by the original capacitors.

If improved selectivity is desired, replace the 1st and 2nd IF
filters together. I also recommend a 6Khz AM filter in place of
the resistor in the AM filter socket. That resistor is the pits!

The bottom line is, if I had a stock R4C and was even remotely
considering a mod or two, I would at least install the power
supply and final audio amplifier mods. If nothing more than
to reduce the huge amount of heat the original circuits generate!
I don't regret any of the mods I installed. The only regret I have
is I didn't install the 2nd IF filter.

629. Replaced Tubes in TR4 Now Low output 80W Max

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-01-23 09:02:33 UTC
From: Frederick Folsom
Topic: 629 Message: 629

Hi All I hope I'm not repeating someone else?
I had to rebuild my AC (MS-4) power supply when it went out.
I did replace All Tubes, But now all I have is 80 Watts out,
Before I had 300-325 Watts, Did adjustments and re-did Adjustments.
Still Low Power out any help??

Thanks.

630. Re: Replaced Tubes in TR4 Now Low output 80W Max

I believe you are mistaking the TR4's power rating. The TR4
is not capable of producing 300 watts "OUTPUT". The TR4 is
rated at 300 watts PEP input, 260 watts DC input on CW
and controlled carrier screen modulation AM.

Have you performed a voltage check of the TR4 as outlined
in the TR4's manual?

I forgot to ask a few additional questions.
You say you are only getting 80 watts output.
Is this 80 watt output reading obtained in TUNE
position or during voice peaks in sideband?
What type of RF meter are you using to determine
the output power? What scale are you reading the
output power from?

From: Dave Vest
Topic: 633 Message: 633

Hi to the group,

Working on a TR-4c and the 9 MHz xtal has drifted off freq and cannot be adjusted to spec with the trimmer. Have not tried padding the xtal as of yet but may give that a try. So if anyone has a parts rig with a xtal still in it they are willing to part with that would be great. I think that all of the TR-3 and 4's all use the same xtal.

Thanks,

Dave, K8DV

If you go to International Crystal's website at the following
link you'll see the list of manufacturers they have crystal
information on. Just provide them with the make and model of
the radio you want the crystal for along with the circuit
the crystal goes in and they should be able to do the rest.
Quite simple actually.

639. Drake equipment for sale

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-01-27 19:05:22 UTC
From: Sharon Heivilin
Topic: 639 Message: 639

Gentlemen,
I have made the decision to sell my Drake equipment that I have had for oh, about 25 years. I'm not going to say they are in prisine condition, but when I last had them on the air in 2000 - it worked. When I moved and turned on the TR4CW after I got settled, the audio was out. I have hung on to them, but I sure have not had it fixed and it's time to clean out the closet. I'm on the air, but not on the Drake. What better group to advertise it with first than this one. If you are interested, contact me and I will send pictures of current condition.
We can dicker on the prices as I'm not that far along in the process if you are serious. I'm reasonable and if no takers, I'll ask locally.
W-4 Wattmeter. #8300
MS-4 Speaker #56550
TR-4cw #43152 (missing one knob and some feet. (I have a few extra tubes, 6ZB6, 12AV7, OA2 (7), D6A.
With a little TLC it will be a fine running station again now that the sunspot cycle will be taking off soon.

641. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-01-28 01:10:17 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 641

All group memebers are welcome to post here on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others (what you put into this group you will get back so participate if you have a chance). Although we would like to focus on Drake Radio subject matter any Ham Radio subject matter is allowed. This includes any QST's of events or hamfests, especially if Drake radios are included

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our groups home page, as well as links to Drake information or your homepage.
Thanks to all members for your particapation.

Don

Subject: [DrakeRadio] Drake equipment for sale

Gentlemen,

I have made the decision to sell my Drake equipment that I have had for oh, about 25 years. I'm not going to say they are in prisine condition, but when I last had them on the air in 2000 - it worked. When I moved and turned on the TR4CW after I got settled, the audio was out. I have hung on to them, but I sure have not had it fixed and it's time to clean out the closet. I'm on the air, but not on the Drake. What better group to advertise it with first than this one. If you are interested, contact me and I will send pictures of current condition.

We can dicker on the prices as I'm not that far along in the process if you are serious. I'm reasonable and if no takers, I'll ask locally.

W-4 Wattmeter. #8300

MS-4 Speaker #56550

TR-4cw #43152 (missing one knob and some feet. (I have a few extra tubes, 6ZB6, 12AV7, OA2 (7), D6A.

With a little TLC it will be a fine running station again now that the sunspot cycle will be taking off soon.

Sharon

I'm sure you'll have plenty of reasonable offers, I would myself but it will take me until

most of the year to pay of last christmas !

of course, I am always up for donations ! :)

Good luck with the sale, and thanks for offering them here to the group first.

From: Frederick Folsom
Topic: 629 Message: 644

TNX for reply!, Watt meter is a B&W VS300A Scale 0-300W
When I got the Rig I always got full scale on X-CW it work
that way for almost 2 years. Replace all tubes. I Didn't
Do any Adjustments at all to the rig.
Yes these rigs were rated at 260W out but alot of them did
more, I had one almost 10 years ago that putout 380Watts
SSB. I think I need to adjust for New tubes...

For a TR4C to produce 380 watts "output", considering everything
is operating at peak performance and the final amplifier is operating
at a minimum of 50 percent efficiency, the TR4C's "input" power would
have to be 760 watts. Using a stock TR4C and either a stock AC3
or AC4 power supply, that's simply not possible. The maximum high
voltage and current rating doesn't support that power rating.

Fred - W5RKL has supplied you with a lot of good information, and did so in a most kind fashion. But, based on your responses, I can tell you for sure that YOU will NEVER fix this TR4. Your observations of the power output in the past are just plain wrong and impossible. The operating characteristics of the 6JB6 are quite well known and your claims of 300+ watts output tells me that you don't understand the very basics of tube or transmitter operation. My advice to you is to send the TR4 to one of the few guys who still work on them and know what they're doing. The WB4HFN website lists W8PU and WA8SAJ as two who currently service old Drake gear.

Chances of your B&W tuner's wattmeter being off by a large amount are very high, especially if you are using an antenna and not a 50 ohm dummy load for your testing. I have no doubt that your output might be lower than before with the new tubes, but you also said you did some power supply work. W5RKL ask if you had done the voltage checks and you failed to respond. Given the power supply work, the first thing I'd do is to check the voltages on the final tubes - and check every one of them. It's possible that pulling and inserting the tubes damaged an already failing solder joint on one of the tube sockets. It's also possible that your power supply work resulted in lower than normal plate or screen voltages. With your insistance that you should be able to get 300+ watts output, it's entirely possible that you popped a screen dropping resistor or two, or simply cooked the new tubes. You didn't mention if the output was lower on all bands, or just one. It would not be unusual for a vintage transmitter or transceiver to exhibit quite different output levels across the bands even when everything is properly adjusted. Here's a link where you can find some other possible causes of low output.
http://www.dproducts.be/Drake_Museum/how_to_fix_.htm

You also should not assume that because you replaced ALL the tubes that the new ones didn't have a defect in the bunch somewhere. The fact that they're new-in-the-box doesn't mean much when the box is 40 years old.

650. Drake 2-B Issue

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-02-01 15:00:36 UTC
From: Randy
Topic: 650 Message: 650

I've got a Drake 2-B that has recently developed a strange issue. The radio receives well and seems to work on all bands, however, the RF Gain control has absolutely no effect (it's always at full gain no matter the position of the gain control). Additionally, the RCV/STBY switch has no effect. Even in the STBY position, the unit keeps receiving. Does anybody have any suggestions as to where I should start my troubleshooting procedure?

Thanks for any help.

Randy

Randy -

Make sure the AVC terminal on the back is NOT shorted to the GND
terminal right next to it.

Any difference between Fast and Slow AVC? Is the receive audio distorted?

This is an EXTREMELY high impedance circuit, and it doesn't take much
leakage to upset it.

Shorted RF GAIN control, leaky cap at C69 or possibly C80.

652. TR-4 bad 9MHz filter (lower) ??

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-02-02 06:58:20 UTC
From: Ryan Pigg
Topic: 652 Message: 652

Hi Group:

I'm still working on my T4-XB (think it's the switch).. But I just picked up a TR-4 and it transmits and sounds normal on 40 and 20 (correct sideband selected by choosing 'x') but on 80, 15, and 10 the audio sounds like it's on a CW filter (too narrow to let the sideband signal through. with careful tuning I can make something out, but it just does not sound right). I'm thinking the 9MHz filter (one side) is bad. what do you guys think? Do these things fail? if it's bad, how do I get one?

Thanks for all your advice and time,

73, Ryan, N7QJ

Ryan,

Your description stated that on 40 and 20 meters with the sideband switch placed in the "X" position, signals sound normal. However, you did not state how the signals sounded when you changed the sideband switch to the non "X" position leaving the band switch in 40 or 20 meters. Taking into account the signal will sound garbled, receiving on the wrong sideband, does the signal appear to be like it does on 80, 15, and 10 meters, very narrow sounding like going through a narrow CW filter?

Have you tried cleaning the contacts on the sideband filter switch? I would do this before replacing the filter.

Yes, filters do go bad but not very often. Replacement filters can be obtained at the following website.

http://www.qth.com/inrad/index.htm

Ryan -

It's very easy to definitively check the filters. Turn on the
calibrator and tune slowly through it. As you tune closer to the
calibrator signal, the S-Meter will go from 0 up to near the peak of the
calibrator level fairly quickly, remain at approximately the same level
for about 2 kHz on the dial, and then drop rapidly back down to 0. It
should be "flat" across the top, with no more than a meter pointer's
width drop from one "edge" to the other. There should be no "hitches"
in the slope on either side, just a smooth edge. Once one is checked,
switch to the other sideband and repeat. You should see approximately
the same shape on either filter.

Hi Mike,
Thank you! Last night I was listening to the radio on 80M. The sideband switch was in the default (non 'x') position. This shows lower sideband. today I'm listening to it on 20 meters and with the non 'x' position it shows up in lower sideband and it sounds like it's on a CW filter. Basically, when ever the switch is in the non 'x' position, it sounds narrow. On 80 meters if I move to the x position, it sounds like a normal radio (I have a R-4B and 2B) but like you said, the signal is garbeled since it is on the wrong sideband.

Today I have it on 20 meters and have to choose the 'x' position (upper) and it works great. So it looks like I can use it on 40 and 20 with no problem. (I have to choose 'x' to get the correct sideband) . I'll check the cabling and clean the switch.

Will let you know. Thanks, Ryan, N7QJ

w5rkl <w5rkl@...> wrote:
Ryan,

Your description stated that on 40 and 20 meters with the
sideband switch placed in the "X" position, signals sound
normal. However, you did not state how the signals sounded
when you changed the sideband switch to the non "X" position
leaving the band switch in 40 or 20 meters. Taking into account
the signal will sound garbled, receiving on the wrong sideband,
does the signal appear to be like it does on 80, 15, and 10 meters,
very narrow sounding like going through a narrow CW filter?

Have you tried cleaning the contacts on the sideband filter
switch? I would do this before replacing the filter.

Yes, filters do go bad but not very often. Replacement filters
can be obtained at the following website.

Ryan,

It sure sounds like one of the 9Mhz filters is bad. However,
without further checking, I'm not putting all my money on that
assumption just yet.

I would also look for any circuit changes, mods, etc. Since you are
not the original owner you can't be sure some previous owner
tried to make some modification that went sour. If you don't
have the manual, you can download it from the bama mirror site
at

http://bama.edebris.com/manuals/drake/tr4/

Topic: 606 Message: 657

Hello all
Bit of a problem here.
No matter how I adjust the VOX controls the Tx won't key in (CW)
until I am on maximum gain (20 past 12 o'clock) But in the 'Tune'
position I get 100w out around 10 to 12 o'clock.With the gain left in
that position the transmitter won't key until I increase it to maximum.

All the valves have been replaced with new and should be OK but it did
the same with the old valves.

So, briefly, any ideas why I should get 100w out on 'Tune' with fairly
low gain but need max gain for the VOX to come in?

Hope I've made myself clear!!

Vic - G4JSS

Vic -

Make sure the CW Delay control is not set to minimum. Set to midrange
to start.

If OK, check C98

In addition to what Garey suggested, check CR16.

660. T-4XB tune up problem? Or is it?

Yahoo group: DrakeRadio (2006 — 2011)

From: w3rxo
Topic: 660 Message: 660

It's been many years since a Drake "B" Line was my primary radio, and have changed antennas several times since, and will soon be changing again(Vertical is just NOT the way to go). But, I am having better performance out of the "B" line, both TX and RX, than on my 570D Kenwood, and it is much more fun to operate. I get comments regularly from folks who are intrigued by someone running a vintage station, and the signal and audio reports are VERY GOOD.
I am currently running an HF6V as my only low band antenna, but plan to hang a multi-band (80-10M) wire (Cobra Ultra Lite Jr.)very soon. I am having no problems tuning up on most bands, but when I tune up on 20M, the load control reaches maximum output only when it is in the fully clockwise position, and then, it does not have comparable full output to what it does on the other bands I typically operate on. Power out, is only 60-75%, on 20M as it is on 75/80M. Am wondering, from those of you with far more experience on Drakes than I, if this may be a transmitter problem, or maybe something inherent in the antenna. I have been approaching it as though it is a problem with the antenna, which will rectify itself, when I change antennas, but someone suggested it may be a tube, or component problem. Any suggestions from anyone with more experience than I have? I ran a "B" Line 19 years ago, when first licensed (as a novice), for maybe a year, then sold the "B" Line and went totally solid state, until about 4 weeks ago, when I dusted off the "new" set of Drakes I bought a few months ago. So my experience is not very extensive.

Almost certainly an antenna problem.. I believe the HF-6V is a multiband, trapped vertical, which SHOULD have reasonable SWR on 20M. You could have a "mechanical (as opposed to wardrobe) malfunction" or a shorted trap resonating capacitor, or a critter has taken up residence inside the coil, etc......

But for a 50 ohm load, the LOAD control will typically be around 4-5 on the 0-10 scale.

Obviously the BEST way to find out is to load the transmitter into a good 50 ohm dummy load. Any station should have a good load capable of handling the transmitter output for at least a minute or so.

That said, it's possible that there could be a bandswitch or capacitor problem in the output matching network of the transmitter, but I wouldn't spend too much effort on it until you can load it into a KNOWN good load.

In the meantime, I'd avoid 20M, since that type of operation is a good way to kill a $40 set of finals very quickly!!

Thanks for the advice. I am in the market for a decent dummy load. I guess the vertical "dummy load" HF6V in my back yard doesn't count (hi, hi). The antenna is ground mounted, so I can easily inspect it, and see no obvious problems with the antenna, but that doesn't mean there isn't one.
It's likely that I'll get the Cobra Ultra Lite up, and operational, before I can find a suitable dummy load, and hopefully, that will solve the problem. I just tried it on 40M, a while ago, and the opposite position on the Load control is where 40 tuned up at (fully counterclockwise), but I was showing MUCH closer to the same full output, as I have on 75M (meter shows a bit over 200 watts on 40M, but about 120-140 on 20M, and closer to 240 watts on 75 meters, all with < 2 watts reflected. But, meters lie a lot, too. I use it only for a reference). I am guessing that there IS an antenna problem, as that is what my gut has been saying all along, and both responses I have gotten lead me to strengthen that thought. I will need to either find, to buy, or borrow, a dummy load right away, so I can make sure that is straightened out.
Thanks for your help. Dan

Unfortunately Dan, the T4XB is not capable of producing 240 watts output. The T4XB is only rated at 200 watts PEP "input" on SSB and AM and 200 watts DC input on CW and that's with everything working at peak performance. The AC3 or AC4 is unable to provide the voltage and current demand for 240 watts "output". The AC3 and AC4, both supplies will work with the T4XB, has a maximum high voltage rating of 650VDC at 200ma average and 330ma maximum. Therefore, the most output you can expect the T4XB is 120 watts DC on CW and 100 watts PEP on SSB and AM. The 120 watts output I mentioned is with heavy loading which is really pushing those 6JB6's, way more than they should be.

The most you can expect to get out of your T4XB is 120 watts DC and that's with heavy loading, pushing those 6JB6's too hard. On sideband and controlled carrier screen modulation, you can get about 100 to about 110 watts PEP.

I suspect 2 things need to be done

1) transmitter needs an alignment
2) the final needs to be neutralized.

Yep, I know it's not capable of that, that's why I said meters lie. I understand the concept of input vs. output, and how much the radio is actually capable of, I simply showed what my watt meter was reading, for reference purposes. Assuming that it is WAY off calibration, it simply shows the percentage of change, on the different bands, with the different settings on the load control.

I think the real problem here is a mismatched antenna.

As you say, the T-4XB will NOT put out over about 160 watts. However the "Bruene" type wattmeters get all squirrely with SWR on the line, and will read a combination of forward and reflected power under mismatched conditions. In fact, if you add a piece of coax in the feedline so that you are measuring at a different point along the line you'll read a much different power.

The "all-band verticals" can have a reasonable VSWR, but are very narrowband, especially on the 80 and 40M bands, and if it's set up for PHONE, might not be so hot at the CW end of the band.

Ok, Garey, now we're talking here. I understand most of what you are saying. But, what is a Breune type of watt meter? I have a Daiwa CN-101L Cross Needle SWR and Power Meter. It rarely shows much reflected power, though at the ends of the phone portions of the bands, especially 40 and 75/80, it does show significant reflected power. My MFJ 269 also shows a reasonably wide <Phone> bandwidth, but VSWR gets up there, in the CW portions, of most bands.
I have always been aware that unless something is being tested on a Bird, with the proper slug, or some sort of lab quality meter, the reading is very suspect. Yes, some can be fairly accurate, but they are typically for reference only. Please educate me on this <Breune> type of meter. I did a search on ask.com, and got nothing of value.
Thanks,
Dan

Dan -

Actually your wattmeter is probably not off cal, just not designed to read accurately in anything other than a properly terminated 50 ohm line. It will also read wildly different power on different frequencies in a mismatched line.

Ya gots ta get 50 ohms on the 'other' side of that meter! :-)

Topic: 660 Message: 669

We got out of sync....

The "Bruene" wattmeter was designed by Warren Bruene at Collins many years ago. It was the first meter for ham use that could be left in the line at all times, AND could be calibrated to read directly in Watts forward and reflected.

Earlier meters such as the "Monimatch" were merely terminated loops coupled to the center conductor of a coax line and read the algebraic sum of the RF voltage appearing at one point on the line. One version involved threading insulated magnet wire through the shield braid of a length of coax and putting a resistor on one end and a diode detector on the other.

Warren put a parallel conductor alongside the center conductor in a coax section to sense the voltage and a toroid transformer that the center section went through, making a single turn primary. A multiturn secondary was then wound and the resultant output rectified to measure the CURRENT through the line. With the known voltage AND current _in a known, constant impedance coaxial line that was properly terminated_ it was easy to "calculate" the RF POWER.

Simplistic explanation, but that is the basic idea that is used by just about all "non-computer" power meters used by hams still today.

Dan Galligan wrote:
> Ok, Garey, now we're talking here. I understand most of what you are saying. But, what is a Breune type of watt meter? I have a Daiwa CN-101L Cross Needle SWR and Power Meter. It rarely shows much reflected power, though at the ends of the phone portions of the bands, especially 40 and 75/80, it does show significant reflected power. My MFJ 269 also shows a reasonably wide <Phone> bandwidth, but VSWR gets up there, in the CW portions, of most bands.
> I have always been aware that unless something is being tested on a Bird, with the proper slug, or some sort of lab quality meter, the reading is very suspect. Yes, some can be fairly accurate, but they are typically for reference only. Please educate me on this <Breune> type of meter. I did a search on ask.com, and got nothing of value.

Garey,
Thanks, so much. It is an education I needed.
I am planning on sending AC-4, to Jeff Covelli WA8SAJ, after he returns from a trip, on the 15th, and have the new board installed in the AC-4. I understand that the power supplies are now beginning to fail, with fair frequency, so it's going to get worked on first. Since I believe the problem we have been discussing is more likely in the antenna, and the tuner I am awaiting, combined with the wire antenna, should solve it, I'll wait on sending in the Tx or Rx, until I have tried to resolve the other possible issues. I even just bought another AC-4, and will have it's board replaced, giving me a spare to use, or sell one, after the whole station is checked out for proper operation.
Thanks for all your help

Hi

More problems!! Haven't had time yet to check on info given re Tx only keying on full gain etc.

But new problem has appeared. I will try and put it as best I can describe it.

On 'Tune' I get 100w at around 280ma IC.

Switch to separate/ transmit and I get the same 100w for about 3 secs and then the IC quickly dies to the quiescent current on the meter with no RF out.

Switch back to 'tune' and 100w out . Switch back to 'Separate' and again 100w for a few seconds and then it dies. etc. etc.

I can hear the relay dropping in and out as per the VOX delay setting which works OK. However, the VOX gain control has no effect at all at min. or max. and doesn't seem to have any control over the relay.

It,s as though the grid block bias has been temporarily removed (key down) and then re-appears - quickly ascending until it blocks the PA's even in key down position.

Taken the TX off line and might get a chance to do a bit of measuring in the next week or so and check the items mentioned by Gary and Mike (C98 and CR16)

Vic -

Make sure the CW Delay control is not set to minimum. Set to midrange
to start.

If OK, check C98

Hi Vic,

Here are few links to some troubleshooting tips for Drake transmitters, including the T4XB.

http://www.dproducts.be/DRAKE_MUSEUM/t4-xb_how_to_fix.htm

http://www.wb4hfn.com/DRAKE/DrakeArticles/Erratic_Power_Out.htm

If you have not yet done so, try cleaning all switch contacts, pull each heterodyne oscillator crystal and clean the pins and sockets. Remove all tubes and give the sockets a shot of cleaner then insert the tubes a couple of times, to get that "scrubbing" action to clean the socket and tube pins. Don't discount a bad tube. I have an SB-401 Heathkit transmitter that had a very similar problem as your T4XB. The output would be good but would drop to zero. Tried cleaning the tube socket and even replaced the tube but the problem still was there. The problem was caused by a poor solder connection at the driver's cathode pin. I notice this one day when I touched the driver tube in transmit mode, the power came back but intermittently. A similar problem can occur with your T4XB with dirty/corroded switch contacts. I also recommend tracing the signal path starting at the 5.645Mhz carrier generator, continuing to the final amplifier.

Just some tips you might consider.

Don -

You might consider what I do on groups that I moderate.

Set options so ALL new members are moderated. When their first post appears, you receive an email from YAHOO, then you evaluate and either allow or deny the post and then change their posting status at the same time.

This eliminates the "drive-bys" and NOTHING goes out until you see that they "belong" in the group.

Thanks for maintaining an excellent group!

Well....I had my hopes dashed.

Just got the crystals in today for my TR-4C from ICM. They sent a
39.1 Mhz crystal for 10 meters. Great for a T-4. Great for an R-4.
Not great for a TR-4C, which is supposed to be 42.5 Mhz.

The customer rep said "But our formula shows Fc + 11.1 Mhz".

sigh

Hi Garey/Mike etc.

Had a few minutes to look inside the T-4XC. Went straight to V10a and did a resistance check from pin 3 to earth. Should be 820 ohms or thereabouts. Actual reading was a direct short to earth. So C98 becomes a highly suspicious character!!

Yep, I've done all cleaning of switches, valve pins etc fairly recently but I glanced inside the relay today and saw a bit of soot and slight traces of arcing between pin 5 and the swing contact. Wasn't there a couple of weeks ago.

Grand kids permitting I might get time to have a proper go next week!!

Vic

Hi Vic,

Here are few links to some troubleshooting tips for Drake transmitters, including the T4XB.

http://www.dproducts.be/DRAKE_MUSEUM/t4-xb_how_to_fix.htm

http://www.wb4hfn.com/DRAKE/DrakeArticles/Erratic_Power_Out.htm

If you have not yet done so, try cleaning all switch contacts, pull each heterodyne oscillator crystal and clean the pins and sockets. Remove all tubes and give the sockets a shot of cleaner then insert the tubes a couple of times, to get that "scrubbing" action to clean the socket and tube pins. Don't discount a bad tube. I have an SB-401 Heathkit transmitter that had a very similar problem as your T4XB. The output would be good but would drop to zero. Tried cleaning the tube socket and even replaced the tube but the problem still was there. The problem was caused by a poor solder connection at the driver's cathode pin. I notice this one day when I touched the driver tube in transmit mode, the power came back but intermittently. A similar problem can occur with your T4XB with dirty/corroded switch contacts. I also recommend tracing the signal path starting at the 5.645Mhz carrier generator, continuing to the final amplifier.

Just some tips you might consider.

683. RE: [DrakeRadio] Re: TR-4 - 9 MHz xtal needed

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-02-08 22:03:06 UTC
From: Walter Milton
Topic: 633 Message: 683

Steve,

I have ordered crystals from ICM for my TR4CW and I told them what I needed. The crystals arrived a week later and worked as if they were the original. I would send them back and tell them what frequency you need for your TR4.

Good luck,

Walt, KA2NJF

From: DrakeRadio@yahoogroups.com [mailto:DrakeRadio@yahoogroups.com] On Behalf Of Steve Matda

Subject: [DrakeRadio] Re: TR-4 - 9 MHz xtal needed

Well....I had my hopes dashed.

Just got the crystals in today for my TR-4C from ICM. They sent a 39.1 Mhz crystal for 10 meters. Great for a T-4. Great for an R-4. Not great for a TR-4C, which is supposed to be 42.5 Mhz.

The customer rep said "But our formula shows Fc + 11.1 Mhz".

sigh

684. T-4x problem on 80 and 40

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-02-09 03:45:56 UTC
From: d104_1
Topic: 684 Message: 684

I have a T-4X that has a driver tuning problem on 80 and 40 meters. The plate current only peaks when the driver is tuned to the frequency of the 5.645 MHz crystal oscillator. The driver tunes properly on the other bands.

I tried shorting the cathode resistor of the pre-mixer (V8) to ground and measuring the voltage on the grid with my vtvm. I get -1.5 to -2.0 volts depending on the band. In fact I get -2.0 volts on 40 meters which will not tune properly, and only -1.5 volts on 20 meters which does tune properly.

Any ideas on the remedy would be appreciated.

Francis

Topic: 673 Message: 685

First, thanks to everyone here for the advice and support ! again all I can say is that we do have a lot of very helpful people here !
After looking over a couple of ways to do it, I have decided to go the way of having all new members place on moderation status.
If I am able to confirm a call sign I will remove moderation status when I approve the membership. Otherwise I will wait until their first post before I do so.
We do have a few members where english is not their primary language, so I do not want to automatically reject a request to join, But this will allow them a good chance to be here while at the same time helping to further protect our group from unwanted spam.

Also, I think it would be a good idea to have one or two co-owners / moderators here just in case anything should either happen to me or my ability to access the net. This would only be for a have-to, back-up situation and not for taking on any current workload. If you own and/or moderate on other groups and would be willing to help with that, please e-mail direct with your info. to: drfrasher at pmt dot org I would hate to have our group fall apart like the old one did.

Thanks,
Don

Don -

You might consider what I do on groups that I moderate.

Set options so ALL new members are moderated. When their first post
appears, you receive an email from YAHOO, then you evaluate and either
allow or deny the post and then change their posting status at the same
time.

This eliminates the "drive-bys" and NOTHING goes out until you see that
they "belong" in the group.

Thanks for maintaining an excellent group!

What happens if you try and transceive with RCVR control with the pair cabled together. Sounds like your Band crystals are not oscillating on 80 or 40M.

The PTO is feeding through at 4955 to 5455 depending upon dial setting and the Carrier Oscillator is running at 5645 so the mixer is seeing both and sending them on!

You may have bad crystals, or Q3 is getting tired. You can swap the crystals from the receiver to check.

From: Dan Galligan
Topic: 660 Message: 688

Alright group, here are the results of putting it on my friend's Palstar dummy load..... No significant changes. On 20M, the load control is still fully clockwise, and on 40M it is still fully counterclockwise, but still tunes up on 75/80, pretty well. Only difference is in the watt meter reading, showing about 140 out on 75/80M, and only about 80-85 out on 20M, with 40 somewhere in between. I apparently didn't write down the meter reading from 40M, but I think it was between 110 and 120 watts out.
All this tells me two things. First, the Daiwa watt meter, as suspected, is GROSSLY inaccurate, and secondly, the problem must be in the radio. Should I be looking at specific tubes? Maybe the finals? Or, is there another something, I should be looking at, as the cause? It seems to tell me that the transmitter, at least, maybe needs an alignment. Is there some area I should be looking at, specifically? Maybe something I could solve without paying for a complete re-alignment?
Thanks for all of your help.

Dan -

OK, that makes more sense.

First thing, I assume that the RF TUNE control is peaking in the appropriate sector of its' dial, i.e., 20M, and not 40M or somewhere else......

Check the neutralization on 15M.

If so, there is something wrong with the Pi-Net. The LOAD control should be in the 4-5 range of its' scale. The third section of the LOAD capacitor should be switched OUT on 20M by the BANDSWITCH. A close visual inspection of Section S4-G, the next-to-last one is next. First check for shorts between fixed contacts and capacitor leads, it's pretty tight in there. Sometimes the switch mounting hardware allows the wafers to rotate slightly, misaligning the various sections. Then make sure that the wiper blade clears the last fixed contact with something connected to it. The wiper of this switch should not be making contact with any fixed contact other than the "common" one on 20M.

A quick run-through of the RF Mixer and INJ trimmers might get a little more, but the 20M problem indicates too much LOAD capacitance on the output of the P-Net.

Here's something I just thought of. The T4XB's manual has a maintenance section that discusses the RF and MIXER slug measurements. As you rotate the RF TUNE control on the front panel, a set of slugs move into and out of the RF and MIXER transformers, adjusting the coils to resonance. With the RF TUNE control set a its clockwise stop, the top of each slug must be a certain distance above the top of the coil form. Check your manual's maintenance section for further details. If the slug distance is not correct then the output will be affected. Check each band as outlined in the maintenance section of the manual.

Possible, but be _VERY_ careful that you have the right measurement for the color slugs in your transmitter and _EXTRA_ careful in measuring before adjusting those slugs individually. I have seen very few cases where they were wrong, and it was obvious someone had been "fixing" them... :-)

On the other hand, the measurements for each band that Mike is talking about are just a more accurate way of setting the RF TUNE control to the proper position before alignment. Sometimes you have to "cheat" a little on 10M to leave any compression on the trimmer caps. It's a good idea to put a little clear fingernail polish on the adjusters for 10 and 15 since they are often so close to minimum that there is hardly any tension on the adjustment and the slightest bump will knock it off resonance.

ALSO.... Do NOT use a metal alignment tool on the trimmers. Even a momentary short between the trimmer and the chassis will damage and even destroy R44. If you use a metal screwdriver, slip some shrink tubing over the shank to cover all but the very tip of the blade.

I cabled together the receiver and transmitter and tried to transceive
with RCVR control. As before, the plate current peaks when the driver
is tuned well below the 40m area.

However, I do hear an increase in signal in the receiver within the
40m area of the driver control.

Francis -

OK.

Transceive operation under RCVR control "should" eliminate the PTO, Band Oscillator and Premixer.

You may just have a BAD misalignment, since transceiving with RCVR control turns OFF the Premixer signal in the transmitter and injects the signal from the receiver. Under Receiver control, the Premix signal from the Receiver is injected, effectively eliminating the PTO, Band Oscillator and PreMixer stages as the problem. Under Transmitter control, this signal comes from the secondary of T5 in the transmitter and is coupled to the mixer via C150 to the "bottom" of the secondary of T3. The SSB signal at 5.645 MHz is applied to the primary of T3 and the mixer output taken from the plate circuit of V3 is at the output frequency. This circuit is the same on all bands, so is not likely the problem.

If you have a general coverage receiver, you can listen for the critical signals at 5.455 MHz (PTO set at 0.0), 18.1 MHz (Band Oscillator for 40M), and the PreMixer output frequency of 12.645 MHz. On 80M, you should find 5.455 MHz (PTO at 0.0), 14.6 MHZ (Band Oscillator for 80M), and the Premixer output frequency of 9.145 MHz.

IF these signals are all present, then their level becomes suspect, and/or the coupling to the Mixer at V3.

Can you measure the frequency of the signal that you ARE getting out when the transmitter is operating on 80 and / or 40M??

Gang:

I have low power output on all bands. Looks like I have a set of soft finals. Some time in the past someone on this list is talked about replacement final tubes that were NOT 6JB6s. Does anyone remember this? If so, what were the replacement tubes? I would like to get a new set of finals and get this old gal back on the air.

Failing that, what is the current price on a matched set of three 6JB6s and where does one get them?

Tnx for the bandwidth.

Rich W3OSS

Rich -

6GJ5. Same tube as 6JB6 except G3 suppressor is tied to cathode internally instead of being brought out to pin. Not significant in grounded cathode, AB1 linear service. Drop in replacement.

Brand caveats apply, Sylvania, Zenith, RCA or GE in that order. Same as 6JB6. Other brands MAY work, but these work every time. Sylvania is the only manufacturer that characterized and published data for Class AB1 linear operation.

Matched pairs are best, but three new tubes of same manufacturer are close enough. RF Parts used to have matched trios, other tube dealers may not know how to match. Drake matched for same idle current at fixed bias, no fancy dynamic balancing.

From: w5rkl
Topic: 694 Message: 696

The link below is an interesting article about substituting
a 6JU6 sweep tube for the 6JB6. I wonder if the same problems
the articles points out will occur with a 6BJ5 sweep tube?

http://www.wb4hfn.com/DRAKE/DrakeArticles/Final_Tubes.htm

I would stick with the 6JB6 tubes as that is what the Drake
TR and T4 series transmitters were designed for. Just my 2 cents
worth.

Mike -

What Ron wrote is quite true for most of the alleged substitutes out there.

There is one major difference in all the others and the 6GJ5. It is literally _identical_ to the 6JB6 in all specifications with the exception of the G3 internal connection. There is a fractional pF difference in the plate capacitance because of this.

The problem with the 6JU6 and others is that the interelectrode capacitances are 50 to 100% higher than the 6GJ/JB6, which put it outside the relatively small range of the neutralization network in the Drake.

The 6GJ5 works just like the 6JB6, including neutralization and 10M operation _IF_ you stick with the "good" brands. The tubes were all designed for operation at 16 kHz, but _some_ brands (the same ones that work consistently in 6JB6s, i.e., Sylvania, Zenith, RCA & GE) work just fine up to 54 MHz in Class AB1 linear service.

699. Re: T-4x problem on 80 and 40

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-02-11 02:58:02 UTC
From: d104_1
Topic: 684 Message: 699

First I would like to say that I appreciate the opportunity to discuss the problem with someone who has experience in working on Drake equipment.

I connected a frequency counter to the cathode of the 6HS6 premixer and the 5.455 MHz (PTO at 0) frequency is there on all bands. Moving the counter probe to the grid of the premixer, the correct band oscillator frequencies are present on each band (80m 14.6 MHZ, 40m 18.1 MHz, 20m 25.1 MHZ, 15m 32.1 MHZ, and 10m 39.6 MHZ).

The counter was moved to the bottom of T3(where a 1.5K resistor connects to ground). On 80m the counter showed the band oscillator frequency (14.6 MHz), and on 40m it also registered the band oscillator frequency (18.1 MHz). The other bands had the correct premixer output frequencies (20m 19.645, 15m 26.645, and 10m 34.145).

700. T-4XC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-02-11 16:59:32 UTC
From: Victor Waddington
Topic: 606 Message: 700

Hello again
Still on with saga of this Tx. Turns out it doesn't appear to be C98 afterall. Now getting the correct reading of about 820 ohm
Yep, you've guessed - no different - still won't key (CW) but still gives 100w on 'Tune' VOX delay works fine (Gain knob pulled out for VOX)
The relay (K1)is marked on the cct. as 15K and the relay also carries a marking of 15K. Take the relay out and the coil is near enough 15K put it back in and measure the 250v line from pin 6 of V10b through the relay to pin 11 on the plug and I get nearly 20K - with or without the valve fitted. I cannot see anything on that circuit which would give me that increase.
However, I am not the worlds greatest circuit reader having come last in that Olympic event.
Any ideas, please.

Vic

Vic,

Have you looked at the grid of V10B, VOX control tube? With the
T4XC in CW mode, closing the key should produce a pulse at the
grid of V10B, pin 7. If this pulse does not appear at the grid,
pin 7, of V10B, then V10B, vox control tube, will not conduct and
the relay will not energize in CW mode. This pulse is generated
by CR16 and C115. This is discussed on page 4-2 of the T4XC's
manual.

I would also verify V3 and V4's grid bias voltage changes when the
CW key is pressed. This is also discussed in the manual no page 4-2.

Just some thoughts.

Vic -

The Mic Amp stage is converted to an audio oscillator in TUNE and CW modes. In TUNE the audio tone is applied to the VOX and Mic input to key the transmitter and generate a steady carrier. Like whistling into the mike.! If the TUNE mode is working, then the oscillator is running, at least in TUNE.

In CW the same tone is applied to the VOX and to the Sidetone Amp to key the transmitter and generate the sidetone. There is a diode-capacitor network to "kick" the relay closed, and this is what causes the VOX relay to close briefly and then drop out if the sidetone is not present.

So the only real difference between VOX operation on TUNE or CW mode is a few switch terminals and R73, the CW Delay control. If this control is turned all the way "down", the VOX will not pull in on CW, but work fine on TUNE or SSB. I have seen a few cases where this control has shorted from the resistance element to ground via the case.

As far as the relay... The circuit is the same with the exception of the CW Delay pot though, so if it works in TUNE, it should work in CW. The problem is not with the relay itself. The original relay in the T-4XC was a Varley, with a 15k ohm coil. They are prone to failure because of the extremely fine wire required to achieve that high impedance. The expansion and contraction with temperature changes (from cold storage to 10 minute transmission!) is enough to break the wire. Humidity is also a problem because the coil bobbin will swell. They're fine as long as they work. The replacment is the same relay used in all the other plug-in Drake 4 Line units, a TYCO with a 2.5k ohm coil. The only modification is a 1.5k ohm 1W resistor added in series with the relay coil and plug it in.

Garey Barrell <k4oah@...> made an utterance to the drakelist gang
---

The long promised CDs for the TR-4 and the TR-4C/Cw/CwRIT are finally done.

If I knew then what I know now.... :-)

Anyway, they are ready. Full information and samples are at my web page.

<www.k4oah.com>

Hopefully all the people who have been asking "when" , will remember
why they wanted one. Or the other... Or both?

I once got a transmit/receive relay from Mouser for my TR4C I now have a T4 does it use the same relay? It's been a long time and I wonder if anyone knows if Mouser still carries it. Dayton

ICM went out of their way to make this right. They
admitted they used the wrong formula (oops) and are
replacing the crystal gratis with a ship date of
Friday 2-15. And they told me to trash the old one.

So if anybody wants or needs a 39.1 Mhz crystal...I've
got one, and I'll let it go for free. If nobody wants
it, it'll go off to eBayland.

Please contact me off list at smatda@... if you
want it.

Thanks,

Steve, KE4MOB

707. FS: Unique Drake Service Information

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-02-13 21:11:12 UTC
From: Garey Barrell
Topic: 99 Message: 707

Unique supplemental service information CDs available for the Drake TR-4, TR-4C, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

I thought I had seen someone on the net who was making/molding them, however I could not find a link to him. It may have
actually been for some other equipment. If I can remember who it was I'll contact them about it and post it here. No luck so far though.
In the mean time I would keep an eye on all the usually places, ebay, qth.com, local hamfest, ect.
You might also check the "links" section of the lists' home page. I certainly may have overlooked something from one of those.
And of course, here still may be someone in the group here who may be able to help, but missed you first e-mail.
Best of luck ! and let us know here if you do find them.

Watch eBay. I've seen the on there several times. You might Google "Drake Virtual Museum" as well. I think I may have seen the same guy advertising them on one of the links there. Hope you find what you are looking for. In a pinch, you might also look an Antique Electric Supply in Arizona. They carry a lot of plastic and rubber feet that wont be exact, but close.

You can get both crystals from International Crystals in
Oklahoma City, Oklahoma. Their website link is provide
below.

http://www.icmfg.com/hamradio.html

You can call them using their 800 number and order the
crystals using a major credit card. Tell them the radio
manufacturer, Drake in this case, and the crystals you want
by frequency.

727. TR7 CW Offest

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-09 23:14:55 UTC
From: Stephen C. Finch
Topic: 727 Message: 727

My TR7 transmits about 600 hz above the receiver frequency. I have checked the settings of the CW BFO and it is correct as is all other modes. It seems that the CW offset varactor is not set correctly. I have to adjust the RIT down 600 hz in order for the transmit and receive not require main dial adjustment.

Does anyone have experience here? Before I sent it out for alignment, I remember that I never had to do that.

Comments??

This didn't happen until after having the radio aligned? Was it done by a business, or a ham friend ? Either way, I think the first thing to do is contact the person who did the alignment. they may have just had an off day, or may not be that familiar with the TR7 and its offset scheme for cw.
Since you sent it out to be done, would I be correct in assuming that you do not have the manual/equipment/experience to re-align the radio yourself?
If so, and the orginal tech is unable or unwilling to correct it, maybe some of us here can recommend a good Drake repair person for you.

In response to Don's (KE7FFM) invitation I would like to introduce myself to the group. My name is Eden (Butch) McCollough, call sign K3AFR. I live in Western Pennsylvania about 60 miles north of Pittsburgh. I have recently been bit by the bug (again) to have another vintage radio station. I sold all of my Collins equipment a few years back and recently a friend wanted me to find an old 6 meter AM rig & get on the air with him and his Lafayette. Well that started me on the quest of a Drake TR-6...which led me to a beautiful T-4X and R-4A...I fell in love with them....they are now part of the center piece of my station. Shortly after finding those pieces I was lucky and found a TR-6 and almost the same time found from a different Ham, an RV-6!! (Very Hard to Find). They are now also part of the center piece of my station. I have posted pictures of my station in the photo section of this site for anyone interested. I look forward to many happy hours of working with my Drakes and hope to work y'all soon. My thanks go to all the members of this group who share their radio problems and solutions here so that we all my benefit. I only hope I can contribute in some small way too. Please give me a holler if you hear me on the air. When not chasing DX, I can usually be found on 28.365 or 50.125 (or maybe 50.400 AM). Thanks & 73 to all....Butch...K3AFR

Not sure if this will work, I haven't checked the data sheets. I also put
in a couple of RFQ's with a couple of places.
I'll let you know what I find.

Hi Don -thanks for looking - Yes, you are right it should be BCP (U9029)
although I think any of them should work. I have tried e-mailing these
guys : http://www.ondaradio.es/ing/catalogoConsulta.aspx?
TextBuscar=14558
As they seemto have them really cheap - 0.21 Euros (about 30 cents I
guess), but haven't got a reply and I don't speak Spanish.

743. DR7 Failure - was 14558

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-14 09:35:40 UTC
From: Paul McKee
Topic: 733 Message: 743

Hi Don and all:
The reason for chasing this part is that I have had a failure on a DR7 and want to make sure I have necessary spares on hand.
The manner in which this has failed is interesting and I'm wondering if anyone has any experience or ideas befor I start tracing signals with the scope. I'm more used to the 4 Series (I have an R4C with all the Sherwood Mods, a T4-XC and a L4B as the active devices in this lineup), so any pointers would be helpfull.
I'd had a problem with My R7, which sits next to the TR7 - normally they are interconnected by both the switching/control/oscillator cable and the antenna cables, so both chassis are at the same potential. When I removed the R7, it was still connected to mains power, but nothing else on it was connected. The TR7 was on. In the processing of moving the R7 Its case touched the TR7 which immediately went off! On powering up the TR7 again, it works, but there is no digital display!

Ideas most welcome!!

744. Very early TR-4 ??

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-15 21:07:45 UTC
From: Mike-K5VSE
Topic: 744 Message: 744

Hello to all,
I have a very early TR-4. I need to replace the electrolytic in it. Now don't all of you tell me it's a 3 section cap. This one is the 4 section, 1" dia.. I at one time was told the values but not the working voltages. I understand I will NOT find a direct replacement, so am going to just wire axial lead types under the chassis, leaving the original for looks. Will someone give me the capacities and working voltages please.

Thanks ahead of time es 73,

Mike/K5VSE

Mike -

I don't know that I've ever seen a 1" dia electrolytic with four
sections, but ...

TR-3
60 uF @ 300V |
20 Uf @ 250V | (Should be 300V also)
10 uF @ 25V | 1" d x 3" max

10 uF @ 25V Axial

TR-4 / C
60 uF @ 300V |
20 uF @ 300V |
10 uF @ 300V |
10 uF @ 25V | 1-3/8" d x 3" max

10 uF @ 25V Dipped Radial

If you can wait a week or so, Tom, N0JMY is in the process of sourcing
NEW twist-lock electrolytics for the Drake 4 Series. Very reasonable
prices.

TR-3 & vy early TR-4 -$21.95
66 uF @ 350V
22 Uf @ 250V
10 uF @ 50V 1" d x 3" max

10 uF @ 35V Axial

From: mdewey@allegiance.tv
Topic: 744 Message: 746

OK Garey,

I just went and looked, and you are right. It is a three section. Bill Frost had told me they did make a four section at one time, and it was he who had given me the capacities, but not the voltages. I'm in no hurry, as it's been this way for a long time. Just annoying when I go into transmit I have to listen to the speaker hum with pure AC. Right now I have to use it, as my twins are down. I took a lightning strike around here a few weeks ago. Got phones, satellite, computer, and radio equipment.

Keep me in mind if the twist lock type become available. I have one of my T4-XC's on the way to Jeff Covelli for his expertise in finding a problem I have been unable to locate. I've got way to many hours on that one.

Thanks for the info es 73,

753. TR7 Aux board question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-18 22:06:15 UTC
From: Floyd Sense
Topic: 753 Message: 753

Without an Aux board in the TR7, accessing the 17 meter band requires you to set the band switch to 21 MHz, and then hit the DOWN button 6 times. From some reading I've done on the Aux board, it appears that with an Aux board installed it may not be necessary to hit the down button provided you have an Aux board position programmed for 17 meters. Is that true?

754. Mic Plugs

From: john baker
Topic: 754 Message: 754

Hey guys,
What kind of mic plug does the TR-4 use? Is there a trade standard description or something? Is it one that you can go down to the local electronics shop and pick up? Will it use the same as Collins or other (I passed up a real nice Collins mic 'cause I didn't know if it would work)?

I've been anxious to get this on HF.

Thanks

756. Low BIAS on T-4XC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-19 01:02:33 UTC
From: Mike-K5VSE
Topic: 756 Message: 756

Hi to all,

Any one have an idea why I would have low BIAS on my transmitter? I've tried two different power supplies and have the same results. Replaced the finals as well. I've measured the BIAS voltages, and can get anywhere from -40 to -70 vdc. So I have to assume the power supplies are OK. The screen voltages on both supplies are a little low. (235-240)

The second question I have, removing the bottom covers from the power supplies, I find them different. One has a terminal strip next to the trio of caps, where the BIAS is developed and some of the secondary transfomer wires going to it. The other has all the secondary going to a single terminal strip and the HV end of the supply. Were there more versions that I need to be aware of? I want to do Mike Bryce's up-grade, but with two versions I might run into trouble. And I'm looking for a third supply as well. Can't afford to get them from the "E" place though, so will wait till I can find one a one of the swap meets comiing up.

Thanks ahead of time,
Mike/K5VSE

Hello everyone,

I am liquidating the estate of a local ham.

I have the following for sale:

A complete station, a very nice Drake TR-4 station. In this package is the TR-4 Transceiver (S/N 28283), RV-4 Remote VFO (S/N Not readable), MS-4 Speaker with AC-4 Power Supply (S/N 38152). Asking $700 plus shipping from 85304 by the least expensive route (usually FED-EX Ground) with insurance.

A Drake TR-4 Transceiver (S/N 32142). Asking $200 plus shipping from 85304 by the least expensive route (usually FED-EX Ground) with insurance.

A Drake TV-1000 Low-Pass filter. Asking $20 plus shipping from 85304 by the least expensive route (usually FED-EX Ground).

An Astatic D-104 microphone wired for the Drake station. Asking $30 plus shipping from 85304 by the least expensive route (usually FED-EX Ground).

A Heathkit Canetnna 1KW. Asking $30 plus shipping from 85304 by the least expensive route (usually FED-EX Ground). Will ship without oil. You can add your own mineral oil.

Interested parties, please contact me off list at kj7bs@....

Pickup is OK if you do not want to ship. However, payment is required to hold merchandise. I will hold merchandise for a reasonable time with payment.

760. R-4B Audio Amp Module Question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-19 02:31:24 UTC
From: W6IDS
Topic: 760 Message: 760

I just began receiving the forum and thought I'd ask about a possible source for amplifier repair. I recall seeing a source that supplied a "drop-in" replacement amplifier "module" for the R-4B. The whole repair required a total removal of the existing metal sub-chassis and parts and replaced with a new sub-chassis and all new components.

Would anyone know if that source or an similar alternate source is available?

Regards,

Howard W6IDS
Richmond, IN

I think you're thinking of the R-4C.

The R-4B has a single transistor preamp and a 6EH5 audio output tube.

The R-4C has a two transistor preamp and a single output transistor on a sheet metal heatsink/bracket. There have been several IC audio amplifiers published over the years, using the LM383 or similar.

YIKES! It sure seems like I was a bit off target, huh? I just broke out my original manual and yeppir. Jeez, I guess it's been a while since I have looked inside the thing.

I was having some "popping 'n crackling" sounds with slightly varying audio not long ago before the audio quit altogether. Lately, I wanted to get inside the thing and get it working and thought I had hit on a simple solution. AHHH, another Senior Moment me thinks.

Guess I'll replace the caps 'n such just to start.

Like your link......will need to obtain the CD; no doubt it's a class act judging from the sample.

Howard, just looked you up in qrz.com as I live in Preble Co, Ohio. Were you aware it shows your license as expired? Would hate for you to have to get a new call. You probably already renewed but just wanted to let you know. John

Subject: [DrakeRadio] R-4B Audio Amp Module Question

I just began receiving the forum and thought I'd ask about a possible

source for amplifier repair. I recall seeing a source that supplied a

"drop-in" replacement amplifier "module" for the R-4B. The whole

repair required a total removal of the existing metal sub-chassis and

parts and replaced with a new sub-chassis and all new components.

Would anyone know if that source or an similar alternate source

is available?

Regards,

Howard W6IDS

Hey, John.....

Just to follow up on your message, I talked with the FCC a few minutes ago and they said not to worry. There's a 2-year grace period for license renewal.
I called the FRN Help Line 877-480-3201 and they sent me in the right direction without a hitch.

PHEW! All's well, they're sending step-by-step instructions by email in a few
minutes. Hmmm.....wonder if I could do that through QRZ.com??

Again, many thank yews! Totally slipped my mind. I'll have to control the automatic PTT reflex pending renewal.

Thanks Mike

The right angle is definetly what I'll need. I have had this TR-4 for a couple of months now. It is in excellent condition and am axnious to get it running on HF. Came with no manual or power supply but I got that covered now. Ready to fire it up now. Thanks again.

"Boat anchors unite!!" =)

BTW, there isn't a rag chewing net on any of the HF bands that happens to be centered around Drake rigs, is there? Just thought that would be fun.

Glad you are getting the Drake gear up and running. You can get the plugs from Mouser and/or Newark Electronics. Just use the Switchcraft numbers and you will find them easily.

As far as I know there still is a Drake net that operates a couple times a week.

Drake User's Net - Tuesday night, 2000 EST 3865 kHz; technical net on Sunday 2000 EST 7238 kHz.
Hope this helps you out.

John,

The synthesizer is unlocked so depending on the band selected the
display will run up to 17 or 33 MHz. Try pulling and replugging the
circuit cards under the display board which are the synthesizer's
several pieces and see if that restores the freq control. The pins
from the mother board to the cards are tinned, not gold plated and
many times get a bit of corrosion on them which disables the receiver.

All you need is to pull each card up an 1/8th inch and push it back
down. Do each card a couple of times. No need to pull them all the
way out as then some of them are trouble to get back in. Make sure
all the little coax cables are plugged in when you reseat each card.

Do all the cards while you're in there as that can cure a bunch of
other ills too.

If that doesn't fix the old girl then its time for a trip to my shop.

772. TR-4C load control settings

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-20 04:58:47 UTC
From: Paul
Topic: 772 Message: 772

Does anyone have a list of where the load control setting should be for the different bands?When tuning up my TR-4C on 20M the load control is almost at 1.As far as the output I haven't sat down and loaded the rig into a dummy load and checked to see how much RF the rig was putting out.

On a another note: When using the 100 kHz calibrator is it normal to pick up a low level signal from the oscillator?The 100 kHz markers are good and strong but a low level tone is heard when the oscillator is turned on. An alignment issue???

Since bringing the radio out of mothballs in December it has been really working good.Besides the power supply upgrade I cleaned the bandswitch and that took care of the intermittent receive/transmit.I've got a couple of minor mods to do (dial lights and a cooling fan) and it will be ready.I had forgotten how great it sounded and comparing its receiver to my TS-520S I think the Drake has a better receiver.But I can't say for sure until I get the TS-520S realigned someday.

I found a very cheap source for the blue filter at my local Wal-mart store.Go to the school supply section and look for a page protector that has a clear front and a blue back cover.It is "officially" called a Clear Cover Poly Brief Folder.The item is made by MeadWestvaco out of Dayton OH and the bar code number is 0 43100 34024 9.The cost for one is 78 cents and theres PLENTY of plastic to cut up for several radios.I just did my radio and it looks great.Theres not much light coming through with the dial lights in the dim position though.

I know several of you have gone the route of the super bright LEDS and that is another good source.That was my second choice if I was unable to find a source of plastic media.The town I live in does not have a crafts store so I'd have to drive 30 miles to get to the closest one.I knew in the past there were blue page protectors and I wanted to see if I could locate something that would be close to the original blue filter.

When my dad had the radio he was cleaning the blue filter and wound up cleaning most of it off, not to mention putting the blue filter in front of the white plastic.The radio dial filter had a faint blue tint still and being the purist I am I wanted to get the dial back to its original look as well as the blue dial glow.Holding the blue plastic up with the original blue filter there is hardly any difference in the color.

Hope this helps anyone who is in need of the blue filter media.

Good Morning to All from snowy Michigan!

I am Curt, KU8L--been licensed since 1962. First Drake was a famous 2A, then a full R-4/T4X system in 1966 as a high school grad present.

Still using it.

Currently adding one of the AC4 board upgrade kits from Heathkit shop and am playing with a Softrock SDR connected to the R4 front end.

I have performed several swept-frequency alignments on the R4/T4 combo--mine are still using the original tube sets!

783. Drake R8 Panel Display

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-03-28 19:54:12 UTC
From: John Swez
Topic: 783 Message: 783

Hi Everyone

I have just joined the Yahoo Drake users group. I have had a Drake R8 for 5 years and it has performed very well.

Just recently the display went out. Although I can still see the display by shining a light into it. Then I

Found out that by tapping on the radio the display comes back and lasts for about a minute or so.

This sounds like a bad or corroded connection. Has anyone ever had this problem? I don?t have a service manual;

They are so expensive! So I am reluctant to take it apart until I might be able to get some hint as to

where to look for the source of the problem. Thanks in advance for any help.

Cheers. John KC9JPZ

I am not familiar the R8 myself, there may be others here who are that
may give you a more
helpfull answer. I would however, strongly recommened getting the manual
before attempting
to take it apart. The manuals will often include assembly diagrams that can
really help with taking it apart,
as well as re-assembly with-out accidently causeing more damage.
The problem you describe is common with dirty connectors as well as a
poor /cold solder joint.
and is generaly an easy repair. carefull cleaning of all plug connectors,
edge connectors, ect., folllowed
with a very close examine of the pcb under magnification for bad joints will
usually lead to repair of this
type of intermittant problems.

This sounds like a bad or corroded connection. Has anyone ever had this
problem? I don't have a service manual;

They are so expensive! So I am reluctant to take it apart until I might be
able to get some hint as to

where to look for the source of the problem. Thanks in advance for any
help.

Cheers. John KC9JPZ

Subject: [drakelist] "B" line and TR4 NEW MAIN TUNING KNOBS

I took a knob survey this summer and had a great response from the drakelist gang, so I decided to make the original complete knob with spun insert available.

They have a 1/4 " brass bushing instead of the plain hole in the plastic. They also have a Allen setscrew. The black phenolic is high gloss, and the spun insert is factory mounted.

COST $20 each..shipping for 1 or 2 is $2. I haven't seen a new main knob in 40 years! They look great. e-mail or call me at 630-879-1132 or kc9ys@....
73's Al..

From: kd8esf
Topic: 787 Message: 787

Hi everyone. I just picked up a TR-4C and I have a question. What happens to the TR-4C if the 34pnb jumper cap is missing? The radio had the noise blanker installed but it was removed when I got the radio and the owner forgot to install the cap on the open socket. The original owner is sending me the missing piece but I thought I'd get some expert opinions. Any help would be welcome. Thanks.

The IF path is open without the plug or the noise blanker.
No harm to radio, just no signal. You can stick a couple of paper
clip wire in the socket to complete the path. Follow the schematic
and look at the wiring underneath to get the correct pins.

Thanks Larry. That's what I was hoping I would find out. 80 and 40
meters are there but really low and 20 meters is just about dead.
Thanks for the suggestion. If the part doesn't come by Monday I'll
try the paper clips.

791. Re: TR7 Aux board question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-07 11:20:43 UTC
From: Floyd Sense
Topic: 753 Message: 791

I'll answer this myself. A major benefit of the Aux board is that you don't have to use the up and down buttons to tune to the desired band segment. For example, if you have it set up for the WARC bands, moving the Aux program rotary switch to the right position results in the desired frequency range appearing on the digital readout. The bandswitch still must be set to the proper band, and if it isn't, the SETBAND light to the right of the S-meter comes on. When you switch the bandswitch to the correct band, the light goes out.

The often-encountered modification that provides for tuning the AM broadcast band segments and below amounts to nothing more than imitating the AUX modules with diodes soldered directly to the card socket pins. You can easily build your own AUX board using a readily available piece of patterned perf board and 1N4148 diodes. The female card pin sockets are still available from Digikey at a very reasonable price. If interested, contact me for the part numbers.

From: Floyd Sense
Topic: 792 Message: 792

In the past year or so, it seems a lot of Drake gear is coming on the market from estates, often being sold by family survivors who have no knowledge of the equipment. As you know, the price of a receiver or transceiver can vary widely based on the filters installed, noise blanker, etc. It might be a good idea for all of us to somehow document what's installed - perhaps a list stapled into the users manual or taped somewhere where it can easily be found. When I go the SK route, I'd like my XYL to be able to easily sell the stuff on eBay for the maximum return with as little trouble as possible. Just a thought.

I am only 43yrs old, but have have the same concerns. while I would want my equipment go to someone
who will use it, I would want it to sold at a fair price for my families behalf.
So I actually have begun the process, placing my notes either in a small zip-lock bag securely taped to the
bottom or back of an item. using the zip-lock bag should make it easier to update the list as needed.
other idea's? maybe having a trusted volunteer form you ham club help with sales? the lsit would still help.

Don
ps. sorry Floyd, I must have missed your first post on the aux board. I believe you have it correct, although
mine was set for BC and I never tried to setup it up for the others.

What a number of us have done is to set up arrangements in advance with other hams that we know & trust to help manage that part of our estates. Usually three or four guys in a group who all agree to help when one expires, so that the widow or widower does not have to deal in a world foreign to them.

That's a good idea and something all of us ought to do. But, some gear like the Drake TR7 presents a unique situation. It's very difficult for someone not knowledgeable on the TR7 to tell what options are installed unless he pulls the covers and knows exactly what to look for. I've inquired into many TR7s that were estate items being sold by a ham and they were at a loss as to how to tell what was installed. Furthermore, they weren't at all interested in my advice on what to look for. After reading a couple the suggestions here, I think I'm going to secure to the bottom of my gear a small label listing the options using clear packing tape which survives pretty well over time.

798. TR7A modulation problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-09 22:34:10 UTC
From: wctaylor@juno.com
Topic: 798 Message: 798

Has anyone experienced a problem with their AM modulation changing on a TR7 or TR7A from dummy load to antenna? I can tune the radio into a load and it looks good on my station monitor scope. Then when I switch to the antenna the modulation will all but disappear. The SWR is about 1.2:1.0 and I don't have any problem at all on SSB. I was trying to talk to someone on 3880 and 3885 a few nights ago and noticed it. I don't like " tweaking the controls " while trying to contact someone, I'm sure people wouldn't appreciate it. If I switch back to the load everything looks fine.

Thanks in advance, 73's
Bill

799. TR4C Realignment

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-11 09:38:13 UTC
From: qrp_monk
Topic: 799 Message: 799

I took out my old trusty TR4C out of mothballs and was hoping she
weathered the storage ok, but evidently she didn't fare well.
Lower sideband was real unstable but upper sideband was a bit better.
The AC4 power supply is where I will start and work my way through
that first.
The book says I need to use a VTVM on the C and luckily I still have
one, tho its been a while since I used it. Hope it still works...
So, if any here have helpful suggestions on any pitfalls I may
encounter and I realize I better replace the filter caps to modern specs.
Where is a good place to find these?
I never used this Drake on anything other than CW and I want to use it
for SSB. I need a high impedance microphone. I have two D104s, one
old, one newer, a Turner +2, Turner +3 and a Yaesu YD-148. Of these,
what what you use? The 104s are high impedance as is the Yaesu which
has a switch for high and low. The Turners which look pretty cool are
low impedance so may have to be modified if that is possible.
Oh yeah, this is my first post in this group and it is great to see
others who value real radios.

Topic: 799 Message: 800

The D104s are great. You can even use one without the impedance matching amplifier in the base since you need a high impedance microphone. I think the D104's look cool also.

801. R7 Alignment question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-11 19:08:25 UTC
From: Floyd Sense
Topic: 801 Message: 801

I recently acquired an R7 and just ran through the alignment procedure. I ran into one odd thing and hope that someone familiar with the R7 can explain it.

In section 3-10: AGC, IF Gain and S-meter final adjustment, Step "b" tells us to adjust the ABC bias pot (R1127) fully clockwise. Nowhere after that is any reference to R1127 made - the only adjustment seems to be to turn it fully clockwise. Seems that, since it's a pot, there would be some info on adjustment to something other than the full CW position. The alignment procedure went as expected and there were no problems, but this one has me puzzled.

Hi Floyd -

You are correct, there is a "missing step" in the alignment procedure. I have a modified procedure at home, but I'm out of town this week. If no one else comes forward with the procedure, I'll be home the middle of next week.

I'd try to tell you from memory, but that's not a good idea!!!

on the tr7 after adjusting the agc for peak, you go back to s-meter pot and adjust it to rest between 0 and 1, but making sure that it is above 0.
not sure if that applies to the r7 as well.

Thanks - that's great, Garey. I have some other things to do
regarding integrating the R7 into the station here, so don't mind
waiting till next week. I've searched in all the usual places, but
could find nothing on the Web relating to the problem. I thought it
might be in VE3EFJ's info, but nothing there on it.

Hi Don. I've compared it to the TR7 procedures, but there are additional adjustments on the R7 and the adjustment values are just too different. For now, it's at least working.

I have a TR-4C that I was trying to put on the air tonight but I think I have a mic problem. The radio has the drake mic jack converted to a phono jack. Could someone please give me the exact wiring instructions for wiring a Shure 444D that has a phono plug? It looks to be currently wired as follows:

red wire to tip
white wire to ring
black (blue? not 100% sure on color but does look blue) lead to sleeve
I didn't do the wiring.

When I key the mic with this configuration the s-meter pegs. What could be wrong here. Any help is appreciated.

for the tr4 , the mic line and the ptt line are inverted : mike on the ring and ptt on tip.... I think you have only to invert these wires on your jack !!! 73 , Serge.

Hi Floyd-
I've purchased several Drake parts from "tr7dude" on eBay. I think
he worked for Drake. He has quite an inventory. Check him out.

I got a call from Drake today re my SW-2. Looks like I blew out the whole front end. All the pin diodes and a couple of FET's. When I get it back, it will NEVER get close to an antenna used by one of my transceivers again. I had it on a grounding coax switch to a G5RV along with two of my tranceivers. Apparently, there was enough RF inside the switch when transmitting from a 100-watt transceiver, even though grounded, to zap the little receiver. Lesson learned!

Floyd -

Home again! :-)

Attached is the "corrected" alignment procedure. I think it originally
came from a French ham, but I can't find it to credit him.

I believe Lee, WB6SSW wrote up the attached, it agreed with what the
other guy said and was nicely written up so that's apparently what I kept.

818. TR7 - temperature controlled fan note

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-16 16:56:44 UTC
From: Floyd Sense
Topic: 818 Message: 818

I recently installed the temperature-sensing fan control as described in the article "Improving the Drake TR7", by KB9Y in Communications Quarterly, 1992. The article suggests just placing the temperature sensing zener diode in the airstream in the middle of the heat sink without mounting it to anything. I followed that advice and encountered a problem that I expected: When the heat sink temperature rises, the fan comes on OK and the airstream soon cools, turning the fan off. In a few seconds, the heat sink radiates enough heat to turn the fan on again, and this cycle repeats for several minutes with each "on" period being shorter than the last.

Mounting the sensor to the heat sink eliminates this problem. I'm going to mount it permanently using some high temperature silicone compound to glue the sensor to the heat sink fins.

Another TR7 I acquired the other day already had a slightly different temperature controlled fan arrangement and with that sensor glued to the heat sink, there is no cycling of the fan after the initial cooling.

By the way, FAR Circuits sells a set of boards for this article and it includes the fan control board. Given the tendency of FAR boards to contain errors, and extra or missing land patterns, assembling the FAR board using this article is like working on a jigsaw puzzle. If all you want is the fan control function, I suggest just buying a small piece of perf board at Radio Shack and assembling the components on that. You can make it smaller than the FAR board and assembly time will be greatly reduced!

From: Garey Barrell
Topic: 99 Message: 821

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

826. R7 mute and AGC problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-24 12:33:55 UTC
From: Floyd Sense
Topic: 826 Message: 826

I'll offer a solution here to a wierd problem I encountered with a recently acquired R7. This R7 had been sitting on someone's shelf for many years with no use.

This problem was intermittent, with no discernible pattern: When operating CW with the AGC M and Mute buttons pressed, returning to receive would result in the receiver being blocked with a recovery time of several seconds. If I switched to slow AGC (M&F buttons pressed), the problem wasn't there, but if I switched back to M, the same problem occurred. If I switched to F only, the problem was not there, but sometimes the RF gain control would not reduce the gain - it was always full on. Working any of the buttons in and out didn't seem to have any effect on the problem and it would suddenly disappear for hours at a time.

One day, I noticed that the problem occurred just after changing the AGC speed, so I suspected the pushbutton switches. I removed both banks of six pushbuttons from the front panel and sprayed a small amount of volume control cleaner into each switch. There aren't any obvious openings, so I just aimed at an area through which the spray might possibly get to the inside of the switch. It's been a few days since the treatment and the problem appears to be completely resolved. I suspect the problem might have been more than one dirty switch. If you have wierd AGC problems with your R7, you might want to give this a try.

829. complete TR7 setup

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-27 02:41:17 UTC
From: Mike
Topic: 829 Message: 829

I was given a COMPLETE set of Drake gear: TR7; MN2700 network; L7 amplifier & ps; RV7 remote vfo and PS7 power supply. Since I am about to put my IC-751a in the shop for "tune-up/mods". What should I expect out of the drake setup...other than a BIGGER work desk in the hamshack? I haven't tried the drake setup out yet, but have been told the TR7 has a slight delay after turning it on, is this normal for a solid state?

Question 2: will a G5RV handle a L7 amplifier for legal limit, or what antenna do the other members have to recommend for such a beast?

Counting my Blessing!

830. Problem with TR-7A

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-27 17:37:09 UTC
From: querencias
Topic: 830 Message: 830

After retrieving my TR-7a from the shed behind my house it no longer worked correctly. The frequency display was jumping all over the place but after a day of "cooking" the correct
frequency (as best I can tell) display stabilized and has been ok for several days.

No signals are heard and the transmitter produces no RF. Any suggestions for beginning the trouble shooting?

thanks
Grant/KT6L

831. Re: [DrakeRadio] Problem with TR-7A

"I sit therefore I quit."

Sounds like you need to take off all the covers, remove the display board, remove the inner compartment covers and pull and replug all the boards several times. You don't have to pull them out, just move them up and down 1/8th inch. Otherwise you'll have to unplug the little coax PITA cables too.

The Molex type pin/socket used on the boards are tinned, not gold so they corrode over time.

There are half a dozen screws that hold the mother board to the chassis and a couple of them are ground connections to give each one a tweak to tighten them.

After that its service manual and voltmeter time.

832. Re: [DrakeRadio] Problem with TR-7A

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-04-27 23:15:20 UTC
From: Don
Topic: 830 Message: 832

I myself am not sure of a specific area to check other than to start from the beggining.
do you have a copy of the service manual? it will certainly help out.
As your problem appears to be affecting both rx and tx, I would start checking for common areas.
first really good visual inspection for any signs of damage from water and such. check supply voltages.
de-oxit the band switches, the contacts of the individual boards and re-seat them all. and of course
double check all of the simple easy stuff, such as the antenna/coax.
If none of that turns up the problem, I would start with the alingment procedure in the manual until you
find the step that doesn't respond. I understand that the pin diodes can cause havoc, but i do not know
if it would give you those symptoms or not. I would tend think the small voltage control board, pbt board,
osc, relay.
Hopefully there will be some other on here with more knowledge of the TR7 and can give a better answer
to help you out.
keep us posted on your progress,
Don

837. TR7 replacement LED display modules?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-05-09 12:18:42 UTC
From: Floyd Sense
Topic: 837 Message: 837

I recently acquired another TR7 and it's obvious that the display LEDs were once replaced since the new ones were not aligned very well. These LEDs are a bit different from the originals in that you can clearly see the actual LED in each segment whereas the originals had more of a frosted look with even illumination across each segment.

Photos I've seen of the LEDs sold by DF4NW appear to have a nice even illumination like the originals, so I wonder if these odd ones that I have were Drake replacements or from another source. Anyone have any info on this?

838. Cabinet repainting - great results!

Yahoo group: DrakeRadio (2006 — 2011)

From: Floyd Sense
Topic: 838 Message: 838

I recently picked up an MN7 tuner that unfortunately had one of the bad sticky paint jobs. When considering how to refinish the cabinet shell, I ran across the article "Cabinet Repainting Basics" by Mark Gilger, WB0IQK. After reading his description of how to achieve the spackled black finish, I had my doubts about how good the result might be.

Well, I can report that the resulting finish is incredible and really worth the effort. You can hide minor surface imperfections with this type of paint job, and the overall cost is very low. The Wal-Marts around here no longer carry the Krylon semi-flat black paint, but I found it at a local hardware store. If you find yourself having to repaint a Drake cabinet, I highly recommend Mark's technique.

I've been using Rustoleum Satin Black for repainting various 4-line cabinets. It's a near perfect match for the smooth finish cabinets used on the SW-4A, MN-4, MS-4 and MN-2000. Although it's not a textured paint, it also works very well for touching up the transmitter, receiver, and transceiver cabinets. As long as it's not applied too heavily, the original texture will still show up nicely.

The label says "7777 Black" and it has an SKU of 0-20066-77778-4. I've been buying it at Home Depot.

while I am certainly not sure, I would suspect that they were from another souce. there's not many variations
on pinout for the led's, so they may have well been from a local parts house when it was done.
btw, thanks for the report on the paint job !
Also, recently a local ham here picked up a nearly complete tr7 station in truly mint like new condition, for
only $450.
I now really hate him !! hihi. I have seen much worse go for twice that. maybe someday i'll get that lucky.

Subject: [DrakeRadio] TR7 replacement LED display modules?

I recently acquired another TR7 and it's obvious that the display LEDs
were once replaced since the new ones were not aligned very well.
These LEDs are a bit different from the originals in that you can
clearly see the actual LED in each segment whereas the originals had
more of a frosted look with even illumination across each segment.

Photos I've seen of the LEDs sold by DF4NW appear to have a nice even
illumination like the originals, so I wonder if these odd ones that I
have were Drake replacements or from another source. Anyone have any
info on this?

Subj: Re: [DrakeRadio] Cabinet repainting - great results!

I've been using Rustoleum Satin Black for repainting various 4-line cabinets. It's a near perfect match for the smooth finish cabinets used on the SW-4A, MN-4, MS-4 and MN-2000. Although it's not a textured paint, it also works very well for touching up the transmitter, receiver, and transceiver cabinets. As long as it's not applied too heavily, the original texture will still show up nicely.

The label says "7777 Black" and it has an SKU of 0-20066-77778-4. I've been buying it at Home Depot.

Yes - every now and then I hear about someone who comes across a steal on Drake gear. I needed another TR7 and had to buy a whole group of Drake gear from an estate to get it. As luck would have it, some of the stuff doesn't work properly, so there's some work to be done before I can sell it to regain my investment. The sticky paint on the MN7 was my first encounter with that situation and it sure was a mess.

Good question! Especially since it's the first thing up on a Google search. I guess I've never used that site for manuals before, usually I find them easily at the Drake Museum site or Bama. I did do a Google search, but can't explain why I didn't dig into Ron's site when it popped up. Thanks for the tip.

Hi to all the list,

I have come into possession of a Drake hand mic. The only markings on it are RLD P/N 3640201. Can anyone tell me what the impedance of this mic might be. It came with a 4 pin female connector on it. Appears to be brand new as well. I am thinking of using it on an old Yaesu FT-101 series transceiver.

Thanks for any info you guys might have.

Mike/K5VSE

All original cables were 38" long tip-to-tip.

The INJ and CAR OSC cables used a foam inner dielectric and phono connectors with a white insulation. This cable measures 60 pF total capacity.

All other cables used the standard for the day clear polyethelene inner dielectric and phenolic (brown) insulated phono connectors and measures ~100 pF.

Original Drake INJ and CAR OSC Cables = 19 pF/ft = .160" o.d. (foam poly)

RG-62 = 93R = 13.5 pF/ft = 0.240" o.d.
RG-59 = 75R = 14.8 pF/ft = 0.242" o.d.
RG-6 = 75R = 16.2 pF/ft = 0.270" o.d.
RG-174= 50R = 30.8 pF/ft = 0.110" o.d.
Mic Cable (Belden 8410) = Hi-Z = 33 pf/ft = 0.160" o.d. (foam poly)
Mic Cable (Belden 8421) = Hi-Z = 16 pf/ft = 0.180" o.d. (foam poly)
R/S Audio Patch Cable = 28 pF/ft = 0.165" o.d. (poly)

The best choice is the Belden 8421 Audio cable from their "Brilliance" line. It looks just like the other cables, and is very flexible. The RG-62 is OK, but it is 50% larger and far less flexible. RG-62 is also prone to shorting if bent over too small a radius, and is susceptible to heat damage when soldering connectors. The best "feature" of RG-62 is that it is often FREE, since there have been many miles of it pulled out of old computer networks. Belden 8421 is available by the foot from ACK Electronics in Atlanta. Other distributors have it as well, although many require purchase of a full spool.

The only pertinent factor is the total capacity. Impedance and "loss" are not important.

Any _reasonably low capacity_ coax will work if the units are cabled together for the adjustment of the INJ trimmers.

The cable type ONLY affects the LEVEL of the PreMix signal, (5.645 MHz ABOVE the transmit/receive frequency,) and a small DC control voltage between the two. If the shunt capacity is too high, insufficient LO level for the first mixer will reduce the sensitivity of the receiver and the output power of the transmitter.

855. TR7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-05-18 03:41:22 UTC
From: Mike
Topic: 855 Message: 855

I'm new to using the Drake equipment and started using my TR7 today with a couple of question to ask: 1) When I place the Mode selector in CW, is it suppose to key the rig automatically "without a keyer"?

2)Is there anyway to adjust the output on this rig or does it trasmit 100% all the time or is this the function of the Mic gain/Carrier switch?

Thanks,
Mike, WD5CCW

Not sure what you mean by "key the rig automatically". Switching the mode selector to CW puts you in CW mode and makes the key jack active. You can then key the rig with any type of key or keyer you want. There is no way to create CW output without closing the key jack contacts, that is, there's no "tune" switch.

The CW output power level is set with the carrier pot. For full output, you turn it clockwise until the LED comes on when you hit the key. On SSB, output level can be controlled with the mic gain and the arrier level control has no effect.

Bill -

The HP23 is a little underpowered for the TR-3. You can probably get away with it, but ...

The '23 is rated for 700 VDC @ 300 mA at a 50% duty cycle.

The TR-3 needs 650 VDC @ 300 mA AVERAGE, 500 mA Peak.

These power levels are the difference between two 6146 and three 12JB6, or 120 W vs 220 W output.

The 250 VDC @ 175 mA low voltage is OK, and the 12.6 VAC filament voltage at 5.5A is ok.

So if you don't hold the key down too long, or whistle into the mic ...

From: Larry Taft
Topic: 863 Message: 863

Garey,

Any info on the 1-A? I'm working on SN 642 and the question is about the power line fuse. Pictures and later info show an inline fuse inside the cabinet and a 5/8" hole in the back panel. The inline fuse holder in 642 is not original.

I have SN 619 which has a bulkhead mount fuse holder in the hole and the wiring looks original. I suspect a production line change.

Hi Larry -

Well, I've never seen one with a fuse holder. Mine (1957) had an internal fuse. I seem to recall it was a pigtail fuse tucked down alongside the power transformer, but .... I have photos of s/n's 518, 708, 806, 911 and 1056, and none of those have anything in the hole!

I've never seen a "reason" for that hole in the back panel. I don't know of any fuseholders that had mounting screws, more likely it was intended originally for a 7 pin miniature tube socket, for ...?? Possible Q-Mult, or other accy? Also wouldn't imagine you'd want to route the AC line up near the speaker and output transformer!

The only "almost official" version that I have ever seen (changes to 6BF6 AVC circuit) was Version 2 at s/n 453. The original schematic also showed a primary fuse, so it was "always" there.

Thanks Garey, I never really considered the third tube. Oh well I am porobably better off waiting until I can locate the proper supply. Or worse case find a transformer rated at half an amp average at 600 volts. I may ask about locally before beginning a country wide search. I try to stay away from Ebay for such if I can. Thanks again and have a safe week!

These power levels are the difference between two 6146 and three 12JB6, or 120 W vs 220 W output.

The 250 VDC @ 175 mA low voltage is OK, and the 12.6 VAC filament voltage at 5.5A is ok.

So if you don't hold the key down too long, or whistle into the mic ...

Larry -

I couldn't stand it! So I asked Bill.

He doesn't recall any specific plan, but pointed out that it is the standard "punch" for the Cinch 4-Pin plug that was used on all the rest of the 2 and 4-Line receivers, and was included for potential "home-brew" add-ons. (Hams still did that in those days! :-)) I had suggested a possible Q-Multiplier, which of course they didn't have at that time, but would certainly have been a worthwhile addition for anyone wanting to use the 1-A on CW in light of the lack of filtering narrower than the 2.5 kHz Passband tuner. The 1100 kHz IF would preclude the use of the Heath QF-1, which was designed for 450-460 kHz. It might have been possible to get the QF-1 to work at 1100 kHz, but I don't remember anyone doing it. Also, the required power and grid connections required for a Q-Mult could have been picked off "above chassis" by a simple adapter under the first mixer tube.

So your fuse holder was a "field mod". I have since found another photo of a unit with a Motorola "automotive" style antenna connector (like used in car radios,) mounted in that hole, also not original,

Floyd,
Thanks for the reply! Since I am new to this rig (given to me)and still finding things out, I found that a shorted keyer plug had a been placed in the cw keyer jack to make the rig key automatically. I guess the other operator used this rig for mostly ssb. I guess you can vary the output via the carrier for cw with no harm to the rig. I did get alot of 599 reports with the rig green LED on. This rig is a Hoss!

874. New T-4XB problem, just cropped up.

Yahoo group: DrakeRadio (2006 — 2011)

From: w3rxo
Topic: 874 Message: 874

I have a T-4XB, which was recently aligned by Jeff Covelli. It has been working perfectly, since getting it back from him. However, I just moved my entire shack from one end of my house to the other, and after making all connections, and double checking them for being tight, and in the correct order, I am having a problem. I guess that I knocked something out of adjustment, maybe the anti vox, or some other easily accessed side, or rear panel, control. I can tune up, just fine. I can use my Palstar DL2K as an antenna, just fine, in the manner it was intended. I can back the power down, and use the "tune" function to bring the antenna into tune with my Palstar AT4K. But when I try to put a SSB signal out on 75/80M, I get a buzzing noise, when I try to talk. Power up, or down, matters not. When I modulate into my Heil Fin micprophone, i simply get buzzing, instead of a voice signal. Can anyone point to where I might look, to see what got knocked out of adjustment? It only does this when I am modulating an SSB signal, into either my wire antenna, or my Butternut HF6V. When I switch back to the dummy load, it sounds perfect in the headphone monitor, and the meters move in conjunction with the speech being transmitted.

Just a thought ☐ You may have changed the length of your antenna feed line and now you have an RF hot spot at the shack and are getting RF into your mic circuits. One way to test this is to add 6-12 feet of coax onto your feed line and see if you still get the same buzzing.

Steve

Thanks for the suggestion, Steve. That could be a likely culprit. But, this morning, after posting, I wired up my old Astatic G-stand 10-DA, and it eliminated the problem. And, I didn't change the length of the feedline to the wire, and it does so on the wire, also. That doesn't mean that your suggestion isn't the problem, I will add that length of coax and see. Because I do not want to run the Astatic. I didn't spend $200, plus the cost of a Behringer EQ and a boom, to just "look" at the Heil. So, I am willing to look at most any potential solution to my problem.
Also, my finals were getting a bit flat, so I replaced them, and checked neutralization. That brought my output power up from around 90 watts, to somewhere closer to 150 watts, depending on the accuracy of my meters (which we all know that anything, with the exception of a Bird, with the proper slugs, is notoriously inaccurate), but it didn't help with the problem I mentioned.

Another suggestion -

The Heil mic and Behringer EQ will have op amps in their circuitry. These circuits are more susceptible to RF and power supply hum than a single mic. Check the grounding and make sure the mic, equalizer and rig are at a common ground. If you are using a wall wart to power the equalizer, wall warts are famous at having poorly regulated dc.

880. I want to connect an Alpha amp to my T-4XC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-05-27 17:49:20 UTC
From: w3rxo
Topic: 880 Message: 880

The Alpha calls for connection to an ALC circuit. I see an AGC connection on my AC-4, but no ALC connection. Do I just (RCA to RCA plug) jumper these two connections, between the AC-4 and the Alpha 374A? Or, do I have to rely on manually keeping the output power down on the T-4XB? The Alpha is an impressive amplifier, and I do not want to do anything to harm it, or the T-4XB. The Alpha, does a full KW average output, using the "no-tune" passband setting, with the transmitter backed off to only around 30-40 watts of drive. It makes me wonder if the transmitter is maybe averaging more on output, than the 30-40 watts the tune function gives me, when I "back it off".

Topic: 884 Message: 886

I've never had a TR4, but I have a T-4XB, and I believe they are the same. White should be the audio which would connect to the ring. Check for continuity between the foil and the red or black, if one is in contact with the shield (foil), with the mic switch open, it will connect to the shield of the s-230, and the remaining one should connect to the tip. If there is continuity between either, only when the mic is keyed, then that should connect to the tip, and the remaining one to the shield on the s-230 If there is no continuity between either the red, or black, and the shield, with the switch either open or closed, then it likely won't matter much which goes where, it simply closes the circuit to key the relay in the radio, but one will need to be connected in conjunction with the foil shield around the audio lead wire. I attached the schematic, from the Drake T-4XB manual. I don't know if it will allow you to open it through this site, but if not, email me directly, and I'll pass along the schematic. It is VERY simple. If I can figure it out.......you know the rest.

I'll soon have another and improved DDS VFO ready for use with the TR7, and am looking for someone with a TR7, spectrum analyzer and know-how to see what the TR7 output looks like using the DDS VFO. All you have to do is plug it into the RV7 connector on the rear of the TR7 and use it. It's powered from the TR7, so no power supply connection required. I would pay shipping both ways so all you'd be giving is your time. If you are interested in this, please email me at k8ac@.... Many thanks.

Mike,
Still, keep an eye on E-Bay. They have them on there all the time.
Keep your bids low and you may get lucky. Lately I have notice that
they have been going cheaper than I got mine, just months ago.

Hint: Wait till the last minute (half minute) to hit the last 'ok'
for your bid if it is still in your price range. That gives fewer
others a chance to take notice and bid up on you. It has worked
several times for me. It does take a little patience.
Be sure to use Paypal!! ...and check before you bid that the seller
does too.

Happy hunting.

Mike,
Drop me an email to my callsign (at) Mac (dot) com. I have a good deal for you. I have a spare, that I bought, "Just in case", then a short month later, I sent my primary one off to Jeff Covelli, and had the upgrade installed. This one works great, and has no problems. I just overpaid for it (on eBay, of course), and would be happier if I sold it to someone at a fair price, rather than trying to "rake someone over the coals" to get my full purchase price back. We can come to terms easily. I want to get it to someone who can actually use it.

894. FS: Unique Drake Service Information

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-06-08 17:44:41 UTC
From: Garey Barrell
Topic: 99 Message: 894

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

895. TR7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-06-13 09:38:47 UTC
From: Victor Waddington
Topic: 855 Message: 895

Hello all
Need a bit of advice, please.
Am interested in a TR7 which is in very good condition and working order Except one of the digits on the display (1st digit after the decimal point) loses a vertical segment on numbers that have a vertical segment on the right. Hard to describe but an 8 would show like a backwards 3.
Hope you understand what I am trying to say.
So, is this likely to be the counter unit or the LCD? If it's the display itself are replacements available?
He wants about £300 ($600) for it.

Topic: 855 Message: 898

Take a look at http://www.df4nw.de/

DF4NW, Willi sells a replacement display module for the TR7. It replaces all 6 digits in one module and is available in .3" (7.62mm original TR7 size) or .39" (9.9mm) which is slightly larger but still fits in the display window. The .39" are available in red, green or yellow and also a blue one is available for more money. Willi also has a multicolor module available in either .3" or .39" although the .3" has fewer colors to select from. The multicolor module is by special order.

You will find the modules to be good quality.

I hope that helps.

Jim

Subject: [DrakeRadio] TR7

Hello all
Need a bit of advice, please.
Am interested in a TR7 which is in very good condition and working order Except one of the digits on the display (1st digit after the decimal point) loses a vertical segment on numbers that have a vertical segment on the right. Hard to describe but an 8 would show like a backwards 3.
Hope you understand what I am trying to say.
So, is this likely to be the counter unit or the LCD? If it's the display itself are replacements available?
He wants about ?300 ($600) for it.

Hi all,

I am still looking for a power supply for use in my shop with a TR-4. I'm sure someone must have a spare they don't want an arm and leg for. I can't afford eBay prices. Getting too old to fool around with building up a homebrew supply as well. I've come across an old SB-200 wired for 120 that I can use to get on 7245 during the day. It still needs a little work, and probably a set of new finals. We'll just have to see how that one goes. Got parts ordered for it.

Thanks to all es 73

Mike/K5VSE

Good evening all,

I have been enjoying my Swan every night until last night. I had
replaced the g2/bias voltage resisters when I recapped. The resisters
R408 and 409 are 100 ohm going from bias to pin7(G2) of V4 and pin 1
of V5(6lq6).
I must have used improper wattage because last night they blew.
The schematics don't specify.
Can anyone help me out here.
Thanx and 73
Tim in Sac

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Topic: 855 Message: 909

Lo All

Recently acquired a TR7 and just a couple of points that I would like to get sorted.
1) With the AF gain at absolute minimum I can still hear signals at a very comfortable level - is this normal?
2) On transmit I have a nice clean sidetone signal (CW) up to about 40w out. Above that the sidetone gets increasingly coarse as I up the power. Also as I increase above 40w the meter/analogue lamps dim considerably in sympathy with my keying.
I do not have a PS7 and am using a PSU rated at about 22amps. I suspect that when keying the PA's are taking all the gravy but I would have thought my PSU would have been capable of more than 40w without affecting the lamps.
Any ideas, please.

Hi Vic. I was a bit surprised when I fired up my first TR7 to be able to have audio output with the volume control all the way down. Mine isn't very loud at that setting, but the audio output level is enough to be annoying. Some have explained why that's a virtue, but to me it's just a deficient design. I've never seen another rig that behaves that way.

Regarding the power supply - 22 amps is just not enough and I wonder if your supply is rated 22 amps ICAS or 22 amps continuous? When exceeding the current rating of the supply, it's possible that the supply is losing regulation and your output voltage is far below the 13.6V it should be. Check the voltage first and watch what happens as you increase the power. When I first got my TR7, my lamps also dimmed with keying at max output and that was while using the PS7 supply. After fixing some problems in the PA section, cleaning the power supply connections and replacing the two large filter caps in the PS7, that problem disappeared.

912. Re: [DrakeRadio] TR7

Vic -

The volume control not turning the audio completely off is "normal". Some are worse than others, but just about all of them do it. According to Drake, the AF/RF Gain control with switch was assembled from parts bought individually and assembled, rather than being purchased as a unit. The problem is that the power switch actuator prevents the AF Gain from going all the way to the ground end of the pot, until of course the Power is turned OFF. Controls that are purchased as an assembled unit have a different resistance element that displaces the "0" end of the element up where the switch actuator doesn't interfere. There isn't a simple way of dealing with it, other than turning the RF Gain back to silence the output.

By the way, the R-7 has a purchased control, and does not have the problem.

Your sidetone "roughness" is most likely a problem of RF getting back into the radio and/or power supply. This seems to be a problem that is worst on 40M, and of course where the transceiver is near the antenna. Additional bypassing of the power leads helps in some cases, and ferrites clamped on the power leads also help.

The PS-7 power supply has four wires in the cable between the power supply and the transceiver. Two of these leads are used to supply the PA ONLY, and the other two supply the remainder of the radio. This arrangement minimizes the dimming of the lamps caused by IR losses in the power cable itself, but does not affect the dimming that might be caused by the power supply output dropping at the PSU end. So... If you have a four-wire DC cable between the PSU and the radio, properly connected, and the lamps are still dimming, then the PSU may be losing regulation because of the current drawn by the PA.

The other factor is the condition of the PA itself. A properly adjusted transmitter will be set for approximately 120-125W output on 20M. At this power level the PA will draw about 24 A or a little less. 10M will draw a couple more amps for full output, which should be about 110W. The PA _WILL_ put out more than this, up to 200+ watts, but NOT recommended. There is an excellent article at

<http://www.wb4hfn.com/DRAKE/DrakeArticles/TR7_Amp_Repair/TR7-Amp.htm>

that has further information on the PA, and it's capabilities.

Hi Floyd

Thanks for info. At least the audio non cut off seems to be normal - weird and annoying especially as I can't silence the side tone which is controlled by the af gain.

I suspect you are right about the PSU and regulator.

I do not, as yet, have the cct. dia. for this rig the handbook being my only source of info - and that isn't very informative. I was thinking of trying using two PSU's. The 22 amp to the high current line and a 5 amp one to the low current line. My rig is supplied via the battery connection but to be honest it's a shot in the dark.

Any ideas on that?

Vic

914. TR7 CW Offset

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-07-01 14:43:16 UTC
From: Stephen C. Finch
Topic: 914 Message: 914

I recently had repair work done on my TR7. The new alignment improved the MDS by 10 to 13 db. However, I noticed that when operating CW now, I have to use the RIT an offset the receive frequency by 600 hz or so to have the CW transmit frequency coordinated with the receive frequency. I do not remember ever having to do that before.

Question: When you operate CW, do you have to adjust the RIT? Or is the transmit frequency offset from the receive frequency without the RIT?

Thanks,

Steve

Hi Gary

Thanks for info.

Have had another email suggesting that the PSU regulator may not be up to job. As yet I do not have a cct. dia. but was thinking of using 2 PSU's. The 22 amp for the high current line and a 5 amp for the low current line (I am using the battery connection to the rig) but don't really know if this would work. Maybe a stupid idea!!

Apart from that I think the Rx on the rig is excellent - better than my R-4C and FT102.

Cheers

Vic

Hi

Yes. For optimum signal I do have to adjust RIT slightly after transmit. As I haven't had this rig for very long I haven't fully learned how to drive it so it could be me that ain't doing it properly. But, yes I have to adjust.

From: Garey Barrell
Topic: 914 Message: 919

Steve -

All transceivers offset the transmit frequency on CW by "some" amount.
Some allow you to control the offset from the front panel, but most do not.

This offset is typically in the 500 - 900 Hz range, depending upon what
tone the receiving operator likes to hear. IF both transceivers had
ZERO offset, each time you went from receive to transmit, each operator
would have to retune his receiver to get back to "his" tone. This
results in "leapfrogging" up the band on each 'over'. It's not a
perfect system, since each operator probably prefers a different tone,
but RIT solves that problem. Separate receivers and transmitters don't
have this problem!! :-)

I think the offset in the TR-7 is specified as "about 800 Hz". The
offset is also required to move the Carrier Oscillator of the
transmitter to within the passband of the transmit filter, rather than
"down the side" as is required for SSB. So it MUST be moved some
minimum amount, probably at least 500 Hz.

From: Floyd Sense
Topic: 914 Message: 920

Not sure what the range of adjustment for the CW offset really is on the TR7, but I'd be surprised if you could pull the freq so far you'd have zero offset. The service manual says to adjust to 800 Hz, but I have mine adjusted to near 600 Hz. The adjustment procedure is rather strange since you have to stick a screwdriver into and through the rear panel key jack to engage C1136 on the 2nd IF/Audio board to do the adjustment.

Re my previous problems (coarse sidetone and lamps dimming).
Definitely my PSU. Tried using two PSU's - one for the low current circuit and the 22 amp for the PA's. Worked fine with nice clean sidetone and no lamp dimming.
Only a temporary measure as I've just ordered a 30 amp job.
Thanks for all the info and help.
Vic - G4JSS
PS. Is it still possible to get Cinch Jones plugs / sockets anywhere. The one I am looking for fits into the battery connection of the TR7?

Floyd -

It may be possible to "zero" the CW offset. I had never looked at it, but in the TR-7 they use a separate oscillator to feed directly to the 2nd Mixer, bypassing the crystal filter entirely. Wonders of solid state! :-) The crystal is marked 5.645 MHz, so theoretically you "could" set it for zero offset. But you wouldn't want to do that for reasons discussed earlier. The offset should be approximately the tone you like to hear when receiving CW.

The adjustment through the key jack is actually pretty innovative. You use a metal screwdriver so you can "key" the transmitter with the same tool used to adjust the trimmer cap by touching it to the bushing of the jack!

The connector is a Cinch-Jones S-2404-CCT. Now there is the
S-2404H-CCT which is the "ROHS" version and is a little cheaper. Both
are available from Newark in the US, and they have a European branch
called Farnell. The old version is $10 here and the ROHS one is $6.

The US store has approximately 500 of each type in stock!

Hi Garey

Re previous

Got the 30 amp PSU and much better. Still a slight flickering of lamps but I can live with that. Sidetone nice and clean but a bit annoying as it is controlled by the af gain - which doesn't go down to zero volume!!

Re the Cinch-Jones. I tried Farnell and they have a minimum order which meant I had to spend about $50 to get one. So will wait until I need something else that will make up the minimum order.

Take care

Vic

Oops! I take it back. Mouser DOES have a substitute in stock as a
Molex S-5404-CCT for $7.19 each. They do take credit card orders, but I
don't know if there are any additional charges for International orders.

Mouser p/n 538-38541-8404, catalog page 1,327

They do take credit card orders, but I don't know if there are any
additional charges for International orders.

Interesting aside, the connector is only rated for 15A / contact. Cinch
specified less than 1 milliohm contact resistance, which would only be a
25 mV drop at 25A. I wonder if they originally intended to parallel
contacts to handle the 20A+ taken by the PA stage alone, and found they
had to separate the PA from the rest of the radio to minimize the panel
lamp dimming??

929. AC4 bias problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-07-04 22:53:09 UTC
From: K4GM-George
Topic: 929 Message: 929

I have an AC4 which will not allow me to set the bias correctly. Following the manual my idling current ranges from 100 ma to 200 ma. I cannot get it below 100 or even close to the 70 ma as per the manual. The bias pot does turn and the current does vary as above. Before I open the unit to start troubleshooting, I wondered whether my description indicated a common part failure. The TX4C works fine with two other AC4 units so I know its the power supply and not the xmtr. Any ideas appreciated.

George -

Bias Supply failure. Probably leaky electrolytic caps. Repair it
before it dies completely and perhaps takes your finals and/or power
supply with it!

If you measure the bias voltage it should vary between about 45 and 85
volts negative to chassis.

Best approach is the AC-4R kit from Mike at The Heathkit Shop. Replaces
ALL the electrolytics and diodes and resistors, making the supply good
for another 30 years.

Good evening,

You have a wonderful site loaded will great info and unfortunately I have run into a slight snag.
From what I have gathered here there has been some problems with the 9mhz crystal failing on one sideband or the other. My problem is on 20 it sounds real tinny and have been told I am off freq, I will be trouble shooting within the next couple of days.
My question is, does the TR-3 use the same crystal, I may be able to acquire one for cheap.
Thanx again for a great site, I really love this rig and would rather not turn it into a parts radio.

Hello
Got a problem with my ATU.
In order of sequence:-
1) Working away on 40 at around 100w and SWR 1:1. Suddenly large crack like a pistol shot. SWR shot up on meter.
2) Switched to alternative (dummy) and all readings as they should be.
3) Went back to antenna and power out as it should be - around 100w.
Put switch back in reflected position and another more muffled crack and SWR reading all over the place. No adjustment of controls would affect it.
I don't have a cct. dia. of the ATU but what beats me is the fact that it reads as it should on dummy load but switch to any antenna position and it goes all to pot.
I do appreciate that on 'alternative' it goes direct to the connected dummy load and not via the antenna circuitry but as I said, I don't have a cct. dia.
Also (very embarassing) I can't get the damned chassis out of the case.
Looking from the front at the facia does it come out towards you or does it slide out of the back? I have removed the screws but it won't shift in any direction.
Hoping for help

Vic - G4JSS

Which wires from mike are which though? No diagram in base of mike.
Have 5 wires, looks like white/shield blue, black, red and maybe
green?

From: mdewey@allegiance.tv
Topic: 938 Message: 941

The white with the shield should be mic audio.

Take a VOM and connect it to the red and black wires. Push the PTT bar on the mic. If you meter goes to zero, that's the PTT switch. If that doesn't work, try the blue and black. It's got to be one of those pair. Remember the shield and black wire have to be on the sleeve of the plug.

If that doesn't work for you, do a Google search for Astatic wiring diagrams and there will be several sites that have diagrams. As a last resort, I can go out to my shop tomorrow and look at some of mine. Not all of them used the same color code for their wires. It's really pretty simple to do. I've done dozens of them.

Hope this helps you out.

Check your plate meter when you first turn it on. If it goes way up or pegs, you have a shorted tube. Then pull both tubes and turn it on again just to make sure it's not a power supply problem. Then again, there may be other problems in the plate circuit. You will have to defeat the safety switch, so be VERY CAREFUL. THERE IS 2400 VOLTS THAT CAN AND WILL KILL YOU!

944. Success wiring D-104..... Now another question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-07-13 01:54:29 UTC
From: pf596
Topic: 944 Message: 944

Thanks to Mike K5VSE for all your help, blue and red were the PTT wires on this microphone. Thanks again. My question now is tuning the radio for max. output when using my MN-2000 tuner. This is my 1st boat anchor and am concerned about blowing the finals. I found a copy of the manual and the bias adjustment is very straightforward, had a .1 on the plate amperes meter.My questions relate to the tune up procedure. Set all switches in correct position and pots ccw as specified. Manual says to advance the XMTR Gain control until meter move slightly upscale from idling current. Is the .1 considered my idling current, how much is considered slightly upscale, .15, .2? It seems this tuning procedure is used when no external tuner is used, am I correct? I hate to blow out this radio just when I seem to be making some headway. Any help with the Tune-Up procedure would be greatly appreciated. Thanks in advance
Bob-KC9MTW

OK Bob, here we go.

Set the MN-2000 on the band you want to use. Set both controls mid scale.

TR-4: Follow the manual to start with.

Turn the mic gain to about .2ma
Dip the plate, or watch your tuner and just tune for max output.

Then switch the MN-2000 to SWR. Push the button while the TR-4 is keyed in the "X" position. Set the SWR to max.
Release the button. Then, using both variable capacitors, tune the tuner for minimum SWR.

Then, the transmitter sees a 50 ohm load.

Advance the mic gain control to .3ma if it will go that high. Dip the plate, or again watch the tuner and tune for maximum output. That's all there is to it. Remember, do it quickly, as in 10 seconds or so. This will prevent you from losing the final tubes. They are getting a little expensive.

After you do this a few times, you wont even have to watch the plate meter, just the tuner meter. If you are only using the TR-4 make sure the tuner is in the 300 watt position. You wont need to re-tune the tuner unless you move more than abut 25kHz or so.

I hope I made this to where you understand what I was trying to get across. If not, send me a note and we can go further.

73 and good luck. You will enjoy the "Glow in the Dark" radios.

I don't own any radios except Drake and some Heathkit stuff. I will never own a rice box. HI HI

From: pf596
Topic: 946 Message: 946

Mike is wired, tune-up procedure straightened out, I think. I have tremendous RFI problems. Blew out my analog cable box. No problems with either my ICOM or Kenwood TS-520-S though. My TR4, MN 2000 and RV-4 all commonly grounded. Did notice that on 20 meters upper sideband sounds greatand lower sounds "hollow or tinny", hard to describe sound. On 40 meters lower sieband sounds good and upper sounds just as bad as 20 lower. Any thoughts? Thanks in advance. Bob

I like my Astatic 10-DA on my T-4XB, and think one would be a good combination on a TR-4. I also run a Heil Fin, and get reports of fantastic audio. I formerly ran a Shure 526T, which was handy, for controlling the transmit volume, though you couldn't turn it up much, before it sounded terrible.
But, asking which is best, is really a loaded question. Everyone has their favorite. I'd also like to try a Heil Heritage and a Heil Classic, on my T-4XB.

I agree, the D-104 with the 10DA head works well. I use the D-104 (w/amplifier/impedance matching base) and get great reports. I also use the Heil GM Vintage on my B-Line and get great reports but let's not forget the Turner +3 or +3B and the Turner Super Sidekick. They sound great as well, but keep the volume low!

Hi there,

I've tried several different mics over the years with Drake gear. By far, in my opinion, is the Shure 444D, followed by the Astatic D-104 non amplified using the ceramic element. Do not use one with a crystal element or you will sound very tinny.

I've been doing this for over 50 years and might know what I'm talking about. Do not use any form of Heil mics.

Well, I want to thank all of those that responded to my request for their opinions on a good mic for my Drake TR-4. The largest number opinions was for the D-104. When I was a teenager, I used one on a CB base station and it worked great. So I think I will acquire a couple of them and put one on my Drake and another one for my Swan 750CW.

73 and Thanks,

Darrell

From: Don
Topic: 956 Message: 956

REVISED Jul 15, 2008 14:45 ET

Kansas Ham, Son, Electrocuted While Erecting Antennas
While putting up backyard antennas on the afternoon of Sunday, July 13, Edward Thomas, KC0TIG, of Kansas City, Kansas, and his son were electrocuted. The elder Thomas, 65, was pronounced dead at the scene. His son, 27, was rushed to the hospital but died later that day. Initial reports suggest that the antenna they were installing came in contact with 7620 V power lines. Neighbors reported a "loud popping sound" and the electricity went out on the block.

Jacob's 7 year old daughter witnessed the tragedy and ran to the neighbor's yard, calling for help. Byron Kirkwood and another neighbor attempted to perform CPR on the men; the neighbor also called 911.

Robert Mullendore, a spokesman for the Kansas City Board of Public Utilities (KCBPU), was quoted by Kansas City television station KSBH as saying it is rare to survive a shock as strong as the two men received: "There are people who will survive -- they're lucky by the grace of God, it's high energy, it's dangerous, that's why it's up in the air -- you just have to be careful. Even those who survive have pretty wicked wounds and they are lifelong wounds." In the power business for more than 30 years, the spokesman said these accidents are "really rare," saying that he only sees something like this "every two or three years. If you're doing any kind of work like this, you just really, really need to be aware of your surroundings."

Chuck Kraly, K0XM, used to work for KCBPU; he built and maintained the substation that fed the circuit going to the Thomas home: "This is nothing to take chances with. In my almost 30 years as a ham -- and 27 years in the power utility field -- I have seen way too many 'accidents.' Stop and look. If it is close or seems that way -- don't. Find another place. High voltage lines are not forgiving. Your life depends on it. Please follow the warnings. Anywhere close is too close." -- Thanks to Larry Staples, W0AIB, and others who contributed to this story

Hello all
Problems with Tx
Originally it blew a fuse in PSU.
The found that PA's had gone along with the fuse.
Replaced fuse and PA's. Now got IC but can't get a dip. All the plate control seems to do is lower or higher the IC depending which way I rotate it. Basically I think what I am trying to say is that I can't get the tank circuit to resonate.
Any suggestions as to the most likely cause, please.

Vic

Vic -

Are you able to set the idle plate current with the Bias control?

Have you checked voltage from Bias supply? Should be variable from
roughly -45 to -85 VDC with Bias control on power supply.

Hello again Garey

Yep the bias can be set and the -ve voltage is OK. The EHT is also OK.

When I try and get a dip the IC goes down but no dip or rf out. if I turn the plate control clockwise the IC rises and I get about 40 watts out. The load control makes no difference at all.

I haven't had chance yet to check the voltage/resistance measurements. If I had to take a shot in the dark I would guess at the coupling between driver and |PA's or the coupling between the PA's and the tank circuit. Just wonder why the fuse and PA's went.

OK.. Well the finals "suffer" from "sweep tube syndrome", i.e., what made them desirable for PA use (High plate currents at relatively plate voltages) also causes them to destroy themselves if the plate current is not controlled.

Does this occur on all bands? Does the TUNE control peak in the appropriate area for the band selected?

I suspect a bad switch contact or solder joint in the Pi Net area. I don't think the driver coupling would be the problem, as with NO drive the PA should just sit at idle. The Plate blocking cap could be open. I'd start with a careful inspection of the wiring and solder of the Pi Net components, with ohmmeter checks to be sure the PLATE cap stator is connected to the coil and that the appropriate LOAD cap sections for the band selected are connected. The large Dur-Mica caps arranged around switch section G are additional load capacity for the low bands.

Hi Garey

Thanks for info. When I think about it calmly you are obviously right about the driver coupling cap. I say calmly because earlier in the week there was a loud bang from my FT102 and when the Drake went that was the last straw for this week!

Strangely the fault on the 102 was also in the tank cct. but fortunately very visible - the 2kv anode coupling cap had blown apart and the EHT had arced across to earth. Easy to see and easy to fix.

Will go over the Pi cct. with a fine tooth comb - can't afford another set of PA's. Don't know about the U.S. but here they are $76 each.

Many thanks - will let you know what I find.

Vic - G4JSS

OK.. Well the finals "suffer" from "sweep tube syndrome", i.e., what made them desirable for PA use (High plate currents at relatively plate voltages) also causes them to destroy themselves if the plate current is not controlled.

Does this occur on all bands? Does the TUNE control peak in the appropriate area for the band selected?

I suspect a bad switch contact or solder joint in the Pi Net area. I don't think the driver coupling would be the problem, as with NO drive the PA should just sit at idle. The Plate blocking cap could be open. I'd start with a careful inspection of the wiring and solder of the Pi Net components, with ohmmeter checks to be sure the PLATE cap stator is connected to the coil and that the appropriate LOAD cap sections for the band selected are connected. The large Dur-Mica caps arranged around switch section G are additional load capacity for the low bands.

Wow! You might want to consider using 6GJ5s for finals. They are a drop-in replacement for the 6JB6, the only difference being that the Suppressor (Beam) elements are tied to the cathode internally, rather than being brought out to a separate pin. Since the Drake PAs are grounded cathode, AB1, this makes no difference in the operation. As with the 6JB6, they must be neutralized correctly, and there is brand sensitivity. If you can find 6JG5(A)s from Sylvania, Zenith, RCA or GE, in that order, they will work just as well and are lots cheaper.

You didn't answer my other questions.... Does it do this on ALL bands? Does the RF TUNE control peak in the right portion of the scale?

From: Joel Levy
Topic: 964 Message: 964

I have a Drake TR-22 that is now excess to my needs for sale. The transceiver is in excellent condition and comes with original carrying case/ strap, AC cord, DC cord, new NiCad's installed in a working transceiver. Six xtal pairs are installed and I have about 25 additional crystals. A bound copy of the manual is included. Price, $150 shipped to the CONUS. Tnx for reading, 73, Joel AE2JL

Hi

Thanks for info re finals.

Well you were spot on re neutralization. I have adjusted that and lo and behold we have a good dip. On 20m I only get 60 watts out but on 40 I get the full 100 and the max IC I can get on 20 is 200ma.

Didn't spend a great deal of time on the neutralizing and will do a more meticulous set up this evening - as per the book.

Vic

PS. Also get a dip on 80m with around 100w on quite a low gain setting.

Cool! Well, that is indicative of misalignment and/or weak finals, i.e., the output power falling off at higher bands. A max plate current of 200 mA is more likely alignment than finals. Weak Finals typically present as reasonable plate current but reduced RF output on the higher bands.

That said, if you haven't already, you might try touching up the alignment trimmers per the procedure in the manual. Be sure and adjust the trimmers with a non-metallic tool, as shorting the adjustment trimmer to the chassis can damage or destroy R44. Check the value and condition of R44, R53 and R54 along with R59.

Hells bells are you some kind of psychic. I was messing about with the neutralizing and got that right and then per chance saw the trimmers on the side of the chassis. So, I adjusted the 20m trimmers (the only one I have done at the moment) and up came the IC and RF out with a very pleasing dip. Now getting 100w on 20. Don't suppose I've done it right but it works for now!

Just after doing that came back to computer and there was your email.

Think I need a nap!!

Vic

Hi Garey

Just a quick one re the 6GJ5's. Are these a direct replacement without circuit mods?

Just checked and they are less than half the price of the the 6JB6's.

Must be a downside to the 6GJ5 - perhaps you can help on that.

Oh! the T-4XC is up and running again thanks to your valuable advice and help.

73

Vic

Vic -

Wow! You might want to consider using 6GJ5s for finals. They are a drop-in replacement for the 6JB6, the only difference being that the Suppressor (Beam) elements are tied to the cathode internally, rather than being brought out to a separate pin. Since the Drake PAs are grounded cathode, AB1, this makes no difference in the operation. As with the 6JB6, they must be neutralized correctly, and there is brand sensitivity. If you can find 6JG5(A)s from Sylvania, Zenith, RCA or GE, in that order, they will work just as well and are lots cheaper.

You didn't answer my other questions.... Does it do this on ALL bands? Does the RF TUNE control peak in the right portion of the scale?

the 2kv anode coupling cap had blown apart and the EHT had arced across to earth. Easy to see and easy to fix.

Vic -

Drop in replacement. No changes other than to neutralize.

Again, brand sensitive, just like the 6JB6.

Preferred Sylvania, Zenith, RCA, GE in that order. Other brands may or
may not work, depending upon who really made them.

Glad you got the T-4XC going!

970. AC-4 POWER SUPPLY

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-07-19 21:06:02 UTC
From: Walter Milton
Topic: 970 Message: 970

Hello All,

I purchased a AC-4 sometime ago and never tested to see if it was functional. I decided to change out all the capacitors with the AC-4R PCB kit. I have done one earlier when I lost the bias circuit which took out a new set of PhilipsECG 6JB6's. I have 115 VAC on the primary windings and nothing on the secondary nor the filament. With a DVM I have continuity between the primary coils and continuity between each secondary section. I show no continuity
between the primary/secondary or between any section and ground.

Does anyone know the ohms reading for the primary and the individual secondary sections? Also, is it possible to still find just the XTRM for the power supply?

I am open to all suggestions.

Walt.

Hi, Just purchased an R4A and a T4X with power supply, not used for years. Also a R4B and T4XB with power supply. I need to find out how to get them up and running. I have a Varaiac and can bring up the voltage slowly, but how much, for how long and should I hook all 3 pieces and bring them up or just the power supply ? Any help would be greatly appreciated. I would like to put at least one set on hf. KI4EWI

974. TR4C 20M tuning

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-07-28 03:35:02 UTC
From: Paul
Topic: 974 Message: 974

While testing my TR4C I noticed that the the RF tune control peaked the receiver noise about mid range on 80 & 40,and 10M. On 15 M it peaked around 2-3. However on 20M the RF tune peaked at 0 at 14.000 and 5-6 at 14.350. On transmit with the RF tune peaked at 0 I could only get maybe 50 watts (fully tuned up into a dummy load) out unless I turned the Xmit gain up to the 10:00 position. The other bands were averaging around 100 watts with the Xmit gain control set at 9:00 (40M was the best at 125 watts). In a conversation with my dad who I shared the rig with when it was new he said he never did any alignment or touched any of the tuning slugs in the cans while he had the radio. He mentioned that he thought there was a statement concerning 20M operation but wasn't sure.

I myself have not done any alignment on the radio as of this writing. With the receiver noise peaks differently that the other bands I am wondering if I need to go in and peak the circuits for 20M as per the alignment procedure.As far as its operation goes its been a great radio and I plan to use it quite extemsively and keep the TS 520S asa backup rig since it has the 250 Hz filter in

Vic
I assume you've checked the 250 volts dc for excessive ripple and you have wiggled the power supply cable connector to check for poor connections.

I had speaker hum in my TR4CW. The speaker cable shield goes into a power supply cable connector socket. The mating pin in the transceiver is wired to a ground connection bracket. That bracket is screwed into the rear of the chassis using one of the screws which hold the connector in place. It is visible when you remove the bottom cover. I removed the screw, and slipped a folded 600-grit sandpaper in between and sanded the mating surfaces. I replaced the screw and my hum was gone! Hope this helps.
Jim, W6OU

Hi Vic,

I had the same problem on a couple of TR-4's and TR-4C's. It was all related to the AC-4 power supply. I see that some posts are looking for the simple solution, but it seems to never be that way. I might suggest to swap out power supplies if you have a spare, or if all else fails, order the upgrade kit from Mike Bryce at the Heathkit Shop. It's well worth the money, and I've done about 8-9 of them. The power supply can create all kinds of strange problems. Hope this helps you out.

Hi Jim

Thanks for your input which has worked out very well. Thought, well if I am going to change one cap I might as well change them all so changed all the caps in the 250v cct of AC4 and no hum at all. Didn't use a double (hadn't got one!) and a single but 3 singles wired up in the same configuration. Now no hum. Also, there was a bad earth on the speaker shielded cable which has also been put right so that was probably a contributory cause as well.

Station here is now just about all Drake and very happy with it.

Just one more question. According to the copy handbook I have the standing current should be set at 100ma and final loading of IC to around 450ma. That seems very high to me. What figures do you use with your TR4CW?

Vic -

Drake issued a Tuning Alteration Notice when the FCC tightened up the "Purity of Emissions" regulation in this country. It specifies limiting Plate current to 350 mA on 80, 40 and 15M to meet the new specifications for third order distortion. The notice said that the manual instruction to tune for maximum output could be used for 20 and 10M.

450 mA sounds a bit high, but is quite possibly a result of the meter shunt resistor (R45, 2 ohm 1/2W) increasing in value, causing the meter to read high. This is not real critical, except that this same meter is used to set the idle current to 100 mA. If the idle current is set LOW, because of the meter's inaccuracy, the distortion products will be higher still.

A part of the restoration of these transceivers should be verifying the accuracy of the plate meter. Measure R45, and then measure the calculated voltage for 100 mA and select R13 to calibrate the meter.

Typical OUTPUT power for a TR-4C is 200 W on 80, 40 and 20M, 175W on 15M, and 150W on 10M.

Hello again Gary

Well it's likely that there are similar directives here but I don't know . My main interest is keeping the things running - one way or the other!

I run the T-4xc and the TR4c at around 300mA which gives me about 100w out. Probably enough for CW operation.

But thank you for your input.

Enjoy the Olympics - if you can see them!!

Vic

Subj: Re: [DrakeRadio] Re: TR4C

Vic -

Drake issued a Tuning Alteration Notice when the FCC tightened up the "Purity of Emissions" regulation in this country. It specifies limiting Plate current to 350 mA on 80, 40 and 15M to meet the new specifications for third order distortion. The notice said that the manual instruction to tune for maximum output could be used for 20 and 10M.

450 mA sounds a bit high, but is quite possibly a result of the meter shunt resistor (R45, 2 ohm 1/2W) increasing in value, causing the meter to read high. This is not real critical, except that this same meter is used to set the idle current to 100 mA. If the idle current is set LOW, because of the meter's inaccuracy, the distortion products will be higher still.

A part of the restoration of these transceivers should be verifying the accuracy of the plate meter. Measure R45, and then measure the calculated voltage for 100 mA and select R13 to calibrate the meter.

Typical OUTPUT power for a TR-4C is 200 W on 80, 40 and 20M, 175W on 15M, and 150W on 10M.

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Crystals For Sale:

I found an assortment of crystals that can be used for
heterodyning crystals for Drake (and other) rigs.

These are HC-6 Crystals, with the actual crystal frequency listed in
MHz.

7.98, 9.5, 10.5, 11.5, 12.0, 15.0, 16.0, 17.0, 24.7, 25.0,
29.0, 30.75, 32.5, 39.0, 41.9, 42.7, 44.5, 46.0, 46.7, 49.9, 51.1,

Other crystals available:

1000.00 KHz for crystal calibrator

FT-243 Crystals for 80, 40, and 10 meter ham bands

3500, 3625 (W), 3675 (W), 3825, 3838, 3850, 3980, 3990

7081 (HC-6), 7094 (HC-6), 7160, 7174 (HC-6), 7175, 7186,
7189, 7198.5 (HC-6), 7200 (HC-6), 7200, 7207, 7225,
7236.2 (HC-6), 7248, 7261 (FT-243 & HC-6), 7283.33 (HC-6)

7325 (29.3), 7375 (29.5), 7395 (29.58), 7400 (29.6),
7404 (29.616), 7410 (29.64)

All crystals are $8 each, plus shipping from Florida.

I also have many 2 meter crystals in HC-25 holders.
Please e-mail your needs.

Thanks.

I need a 459 KHz crystal for the SP-75 speech processor. I've been to all the usual sources of new crystals and they either no longer produce crystals that low in frequency, or the price to make a new one is astronomical (I received only one quote - $115!). If you have one of these crystals, or know where one can be found for certain, please email me.

Nope - somehow missed that one. I've emailed him and maybe he'll have something I can use. The circuit uses a trimmer to pull the crystal to the exact frequency, but 4 KHz is probably a bit of a stretch. The crystal is in a small can, so can't really do any surgery on the crystal blank itself. But, it does remind me of my novice days a few decades ago when we routinely shifted our crystal frequencies by either rubbing a lead pencil on the crystal blank (moved the freq down) or ground it down (moved freq up) with Ajax and water on a piece of glass! Thanks for the link.

Hello Jose,

Have you done the R4b alignment? I got a R4b from auction. It needs re-alignment. I feel it is a little bit low sensitive (-90dBm at 10db SINDA AM in all bands)and noisy when connect an antenna. Do you have any idea on it?
Thanks,
mkchan

From: w5rkl
Topic: 817 Message: 1004

Hello Jose,

It appears from description of your problem the source of the problem is the R4B's 50Khz BFO oscillator transformer T11 is improperly adjusted. If T11 is improperly adjusted, the 50Khz BFO oscillator signal will not be properly fall within the receiver's PASSBAND. This is why one sideband is readable while the other isn't.

I recommend, as "MK" did, perform a complete alignment on the R4B receiver. Follow the alignment instructions in the R4B manual, starting on page 27 paragraph 6.4 If you do not have the R4B manual you can download it free at the following website.

http://bama.edebris.com/manuals/drake/r4b/

Aligning the R4B is not difficult as long as the instructions in the manual are followed. I would not simply adjust T11 without the test equipment called for in the manual as you can make the problem worse.

Hello MK,

More than likely, as you have indicated, your low sensitivity problem with your newly obtained Drake R4B is caused by age and alignment.

R.L. Drake built the R4B and other Drake receiver's well and most only need a slight "touch up" in alignment. However, I've run across a lot of vintage Drake receivers, transmitters, and transceivers where previous owners adjusted transformers and capacitors without knowing what they were doing.

It's very important to follow the manual's alignment step and the order in which they are done. If this is not followed, the problems can be easily made worse than they already are.

Mike,

Is an account needed to be established before anyone is allowed to download manuals?

Howard Ws6IDS
Richmond, IN

Doesn't look like it. I just clicked on the link shown above, and went directly to the BAMA mirror site for the file. Note that it is a DJVU file, so you will need to have a DJVU viewer on your computer (free.) See the help on that page.

Dick - W6CCD

1008. Re: Help with R-4B alignment

From: w5rkl
Topic: 817 Message: 1008

There's no account requirement to download manuals. As stated by W6IDS, you will need to DJVU reader which can be obtained through an icon link from the bama website link. Click on the link below then when the page comes up, scroll down to the bottom of the page and click on the DjVu icon.

http://bama.edebris.com/manuals/

The DjVu viewer is like the Acrobat Reader. When you install it, everytime you click on a DjVu file the DjVu read comes up so you can read the file.

Hello Vic,

I'm not aware of an RIT modification for the TR-4C. This doesn't mean one doesn't exist.

The one thing that must be taken into consideration when modifying a Drake PTO for RIT is the PTO's stability. Drake PTO's are quite stable and any modification/changes made to incorporate RIT can affect the PTO's stability in both receive and transmit.

One could compare the TR4C's schematic against the TR4CW's schematic, make the RIT circuit changes to the TR4C. However, if this isn't done right, the PTO's stability and frequency can be affected in both transmit and receive.

A much safer, more stable, and easier route is to obtain either a Drake RV3 or RV4C remote VFO. The RV3 remote VFO can be modified to work with the TR-4C by simply adding a resistor between the RV3's voltage regulator tube and the RV'3 function switch then simply plug the RV3 into the bottom socket on the TR4C. By going the RV3 or RV4C remote VFO route doesn't require any modification to the TR4C, no drilling a hole in the front panel for the RIT control pot, and the TR4C's PTO's stability is maintained. The addition of the resistor to the RV3 does not affect the RV3 or the TR4C's PTO stability one bit. Of course, the RV4C is a plug and play addition to the TR4C, not modification needed.

The TR-4CwRIT PTO is different than all the other 4 line PTOs. There is a small terminal on the side of ALL PTO units, but while the "RIT" version converts an applied DC voltage to a 6-10 kHz shift, all the earlier units shift less than 1 kHz when an external capacitance to ground is applied. The same "RIT" version PTO was used in the TR-7.

Mike has the right idea, stick with the RV-3/4.

Hello all,

Well, my message was posted some weeks ago and, in the mean time, I found the culprit... it was mostly a missaligned PASSBAND knob!. Yes, curiously enough, USB position was close to be OK but in LSB positions, it was definitely wrong (perhaps a 180 degree missalignment?)

All in all, once I read the alignment procedure, it was pretty obvious something was not OK. I have not yet completed full alignment but it seems someone attempted it with the missplaced knob... oh well.

Thanks a lot for all your suggestions. As I am still in the process of finishing work on it, they will be sure helpful.

Regards,

JOSE

Thanks Mike and Garey

Understand the points you have made. Small sticking point is that trying to source a RV3/4 this side of the pond is like trying to find a dinasaur egg!!

Cheers

Vic

Hello Jose,

Congratulations. Aligning the 50Khz BFO, as you have seen, requires the PASSBAND knob connected to the PASSBAND variable capacitor to be centered on the front panel marker. I had a similar problem with an early version of the R4C I bought on eBay a few years ago. The PASSBAND knob and associated variable capacitor were correctly centered but the T11 50Khz oscillator transformer adjustment was way off. I still have the R4C but it needs a new set of tubes and some additional work.

Again, congratulations Jose.

>to source a RV3/4 this side of the pond is like trying to find a dinasaur egg!!

Living in Spain, I thought the same... until someone offered me, locally
(in Spain, I mean), a nice, mint looking, TR-4Cw RIT, RV-4C and AC-4/MS-4
for 240 Euro... only problem it has is that the TR-4 is about 100kHz out of
frequency (on main VFO, RV-4C is fine)... guess what I did ;-)?

Anyway I know this is not a common happening (*). Good luck with the search!

Regards,

JOSE

(*) Well, I should be lucky... some weeks ago I bought, also from an
Spanish ham, a decent looking TR-4C along a homemade (but VERY well done)
power supply / speaker, for the princely sum of 90 Euro. Of course, this is
a lots worse offer than the TR-4Cw RIT set but, anyway, it is a good one.

Mike -

The Passband tuner in the 2-A/B & R-4/A/B doesn't use a variable capacitor like the C. The earlier versions use a four-slug rack that is cam driven by the Passband knob. The BFO must be on frequency for all versions!

Yes, we talked about it but have had no time yet to fix it... I hope it is
just dial missalignment, as you suggested.

Best regards,

JOSE

Hello Jose,

Is the 100Khz off frequency problem occurring on "ALL" bands or just one or two?

If only one or two bands are off frequency, the problem is not the PTO but rather the individual affected band's heterodyne oscillator crystals.

Even if the 100Khz off frequency problem occurs on ALL bands, it's quite possible the PTO is not the problem but rather the dial is out of alignment, especially if the 100Khz off frequency problem occurs at the same dial setting on ALL bands.

Other possibilities are the individual band heterodyne oscillator crystals but I seriously doubt all four, 40 through 10 meters, heterodyne oscillator crystals are bad. 80 meters doesn't have or use a heterodyne oscillator crystal. Instead, the heterodyne oscillator operates as a straight through amplifier on 80 meters where the PTO signal and the 9 Mhz IF signal mix to produce the 80 meter operating frequency.

The Drake PTO produces a variable frequency that is between 4.999Mhz and 5.500Mhz, regardless of the band selected.

Just a few thoughts.

1023. RIT for the TR4C

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-08-19 18:09:39 UTC
From: w5rkl
Topic: 985 Message: 1023

I just downloaded the TR4CW manual on bama's mirror site. There's a schematic of the RIT circuit in the beginning of the manual and a note about it from Drake.

I still believe the safest route is the RV3 or RV4 remote VFO.

Here's the link to the TR4CW's manual. It requires the DjVu reader which can be downloaded through a link on the same bama mirror website (see second link below).

http://bama.edebris.com/manuals/drake/tr4cw/

To download the free DjVu reader, use the following link and click on the DjVu icon.

Looking at Drake's TR4CW RIT circuit in the TR4CW manual, I looked up
the two main components of Drake's TR4CW RIT circuit. This is what I
found through Mouser Electronics online catalog.

Drake's chip part number is: MC14016BCP

Mouser's replacement part number: 512-CD4016BCN
Mouser's price for the 14 pin dip chip: 48 cents

Drake's diode part number is: 1N4744A
Mouser's replacement part number: 512-1N4744A_T26A
Mouser's price, 8 cents.

These and the other components can possibly be obtained through your
local parts dealer, prices will differ of course.

This doesn't mean I suggest performing the mod. It only means that
someone asked for the information and this is what I found, nothing more.

Mike -

That schematic is of the DC switching circuit ONLY for the RIT. It is NOT retro-fittable (?) to a TR-4CW or any earlier version because of the
difference in the PTO for the RIT version. The PTOs "look" identical from the outside, but the internal circuitry connected to the side
terminal is entirely different.

The only published schematic for the PTO used in the TR-4CwRIT and TR-7 is in the RV-7 Remote PTO manual for the 7 Line. The RIT portion
consists of a couple of resistors, several caps and a varicap. I suppose similar circuitry could be added to an earlier PTO, but would
almost certainly require complete rework of linearity and temperature compensating caps. I have the schematic if anyone is interested.

A possible alternative to the RV-3/4 would be the FCC-1/2 kit from NORCAL. It's a DDS frequency generator and counter that could
replicate something similar to the RV-75. I believe the kits would be less than $100.

Garey,

I'm not doubting you Garey. However, based solely on Drake's RIT schematic in the TR4CW manual page vi, on Drake letter head even (barely noticeable on the upper left cornet of the page) the caption on the schematic clearly states, "RIT Schematic Diagram". The caption can be quite misleading to say the least!

Oh well, hopefully folks will notice this so they won't make the same mistake.

Anyway, thanks for the correction.

1027. Re: [DrakeRadio] Re: RIT for the TR4C

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-08-19 19:42:04 UTC
From: Garey Barrell
Topic: 985 Message: 1027

Mike -

Yes, the Drake docs are somewhat misleading. They only added that one sheet addendum to the Cw manual, and didn't change the PTO schematic to reflect the internal changes.

You can confirm what I am saying by comparing the schematics for the PTOs for the TR-4/C/Cw with the schematic for the TR-4Cw_RIT_ which ONLY appears in the RV-75 manual. All previous PTO "side terminals" were intended to shift the PTO by either 170 or 850 Hz by diode switching an external capacitor for RTTY transmission. When the "RIT" version was designed they used the same terminal to access the internal PTO varicap. By the time this change was made, most amateur RTTY was via AFSK (SSB), plus I doubt there were many TR-4's used on RTTY anyway! :-)

I've attached the schematic, I don't remember whether this list allows attachments or not.

Hello Mike,

>Is the 100Khz off frequency problem occurring on "ALL" bands or just
>one or two?

Yes, on all bands.

>If only one or two bands are off frequency, the problem is not the PTO
>but rather the individual affected band's heterodyne oscillator crystals.

Nope :-)!

>Even if the 100Khz off frequency problem occurs on ALL bands, it's
>quite possible the PTO is not the problem but rather the dial is out
>of alignment, especially if the 100Khz off frequency problem occurs at
>the same dial setting on ALL bands.

Yes, this is what Garey said some time ago, when I first posted about that problem. But I have been unable to find the time to get into that rig yet.

>Other possibilities are the individual band heterodyne oscillator
>crystals but I seriously doubt all four, 40 through 10 meters,
>heterodyne oscillator crystals are bad. 80 meters doesn't have or use
>a heterodyne oscillator crystal. Instead, the heterodyne oscillator

>signal and the 9 Mhz IF signal mix to produce the 80 meter operating
>frequency.
>
>The Drake PTO produces a variable frequency that is between 4.999Mhz
>and 5.500Mhz, regardless of the band selected.
>
>Just a few thoughts.

...which I appreciate a lot!

I will let you know how things end, once I get into my TR-4Cw RIT.

Regards,

JOSE

From: w5rkl
Topic: 985 Message: 1029

Afternoon Garey,

I received the schematic from you via e-mail from the group. I'll print it out and look at it later on this evening.

As I said earlier, I don't doubt your word. I did some additional research on the Drake Museum and it appears back when Drake was still in the ham gear business, they would modify a TR4C, adding RIT, for $100. In addition, it appears the TR4C RIT mod must also have been an optional item one could have purchased from Drake back in the 70's to modify a TR4C. The other thing is, once a hole is drilled in the front panel the value of the radio just dropped considerably unless it was done by Drake many years ago.

Personally, I wouldn't modify a TR4C to add RIT. I would go the RV3/RV4 route which was indicated not only my initial response but also in the Drake Museum as well.

I have a Heathkit HW-101 that was given to me free (sat in a garage for 20 years never powered up). It had an RIT mod installed and it was worthless. The LMO was unstable, more than normal, and the RIT mod produced chirp on CW, whether it was turned on or not. I removed it and now the front panel has the two holes, one on each side of the meter, where the RIT controls were. I'm still working on it but it's a lot better than it was when I got it.

Have a good one Garey and I'll take a look at the RV7 schematic later on this evening.

Hi all

Thanks for all the info and help. I think I'll hang around and hope an RV4 pops up somewhere but I suspect I have more chance of winning the National lottery!

Jose, I also think that your 100Khz problem is with misalignment of the tuning scales. I had exactly the same problem with the Tx-4 The nylon gearing was very stiff so I took it out to loosen the cogs on there shafts. When I put it back I had put the tuning dial 100Khz out (obviously the same on all bands) Very easy to put right. Stick your finger in and pull back the sprung shaft thus disengaging the gears and then rotate the tuning dial plate which ever way it needs to go. Make sure the cogs are properly re-engaged when you release the sprung shaft.

Vic

From: w5rkl
Topic: 985 Message: 1031

You're probably right Vic. The RV3 and RV4 VFO's are quite scarce these days and when you find one the prices can be outrageous!

Although I have a few rice boxes with built-in RIT and one with a remote VFO, I honestly don't use the remote VFO that much. Most of my air time is with the C Line. I like the flexibility of operating separates. Remote VFO's are nice but there's no comparison, in my opinion, to the twins. I do miss the TR4C and B Line I had, should never have sold them! Oh well, that's water under the bridge.

Garey, I reviewed the RV7 VFO schematic you sent. Although there are some basic similarities, the RV7 VFO is quite different. I haven't compared it with the TR4CW but I did compare it with the TR4C. The RV7 doesn't have the FSK terminal as the TR4C, and other T4<any> PTO's do. Anyway, it's quite obvious that modifying a TR4<any> transceiver to add RIT would be quite a challenge. More than likely the original TR4<any> PTO stability would be lost.

Anyway, good luck Vic. I'm sure you'll find an RV3 or RV4 soon. Don't know if you have ever been to the annual Friedrichshafen ham fest in southern Germany or not. It's Germany's version of the Dayton Hamvention. Huge ham fest! That's where I bought my second Drake R4C for less than $100 USD 8 years ago. I still have that R4C which I modified heavily with Sherwood and INRAD mods and upgrades and use it with the T4XC which I also picked up on eBay. Great receiver! I was DA1TNJ back then.

Mike -

All of the TR-4 series PTOs are the same, aside from a few semiconductor device changes over the years, until you get to the "RIT" version. The "RIT" version was then used in the TR-7 line, including the RV-7 Remote PTO. The physical FSK terminal of the earlier version was changed to the RIT terminal.

That unmentionable auction site has several of the RV series units at any given time. Recently completed auctions range from around $100 (RV-3) to $155 (RV-4C). A super clean one might sometimes go for more. Not at all outrageous, in my opinion.

There is currently an RV-4C auction in progress with the bidding up to $355. Now THAT'S outrageous!

Hi Mike

Thanks. Yep I also have the C line twins and I also prefer using separates. I like my TR7 and TR4C but the twins win.

Cheers

Vic

Sorry, no I've never been to the German fest and do most of buying what I want from Ebay or members ads in the Radcom monthly mag.

Subj: [DrakeRadio] Re: RIT for the TR4C

You're probably right Vic. The RV3 and RV4 VFO's are quite scarce these days and when you find one the prices can be outrageous!

Although I have a few rice boxes with built-in RIT and one with a remote VFO, I honestly don't use the remote VFO that much. Most of my air time is with the C Line. I like the flexibility of operating separates. Remote VFO's are nice but there's no comparison, in my opinion, to the twins. I do miss the TR4C and B Line I had, should never have sold them! Oh well, that's water under the bridge.

Garey, I reviewed the RV7 VFO schematic you sent. Although there are some basic similarities, the RV7 VFO is quite different. I haven't compared it with the TR4CW but I did compare it with the TR4C. The RV7 doesn't have the FSK terminal as the TR4C, and other T4<any> PTO's do. Anyway, it's quite obvious that modifying a TR4<any> transceiver to add RIT would be quite a challenge. More than likely the original TR4<any> PTO stability would be lost.

Anyway, good luck Vic. I'm sure you'll find an RV3 or RV4 soon. Don't know if you have ever been to the annual Friedrichshafen ham fest in southern Germany or not. It's Germany's version of the Dayton Hamvention. Huge ham fest! That's where I bought my second Drake R4C for less than $100 USD 8 years ago. I still have that R4C which I modified heavily with Sherwood and INRAD mods and upgrades and use it with the T4XC which I also picked up on eBay. Great receiver! I was DA1TNJ back then.

> Jose, I also think that your 100Khz problem is with misalignment of
the tuning scales. I had exactly the same problem with the Tx-4 The
nylon gearing was very stiff so I took it out to loosen the cogs on
there shafts. When I put it back I had put the tuning dial 100Khz out
(obviously the same on all bands) Very easy to put right. Stick your
finger in and pull back the sprung shaft thus disengaging the gears
and then rotate the tuning dial plate which ever way it needs to go.
Make sure the cogs are properly re-engaged when you release the sprung
shaft.

From: w5rkl
Topic: 985 Message: 1036

Garey,

Yes, you're right.

I decided to pick up some solid state component replacements in the event something fails in either the T4XC or the R4C. Although the physical body looks the same, the pin orientation between Drake's original 2N5950 and Fairchild's 2N5950 are not the same. Drake's pin orientation is Gate Drain Source but Fairchild's is Gate Source Drain. This requires reorienting the Drain and Source pins. The PTO, first IF in the R4C, and the calibrator uses them.

Hey Vic,
Keep an eye on e-bay. You'd be suprised how often they show up on
there. I'd say in the last 6 months or so I've seen 4 or 5 of them.

Good luck

Does the Sherwood roofing filter mod for the T-4XC work on the TR4Cw or is that essentially a different radio ?

Hello George,

The TR4 series had two individual sideband filters, one for LSB and one for USB. I can't say for sure whether the T4XC filter will work with the TR4CW or not. Maybe Garey will chime in with additional information on this. My initial thought it no.

Thanks guys. I am very familiar with the twins but the xcvr is unfamiliar territory. Guess the 500hz built-in filter is as good as it gets for cw on the TR-4Cw.

1042. Drake 2A

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-08-23 03:35:54 UTC
From: jfelts13
Topic: 1042 Message: 1042

I just got a Drake 2A today and I'm not so sure about it. Ok it works, needs to be recapped. CW and SSB don't tune right sorta raspy sounding. I'm guessing new caps are in order.

Tuning is slower than the 7 year itch. hi I would hate to try and go from one end of the band to the other.

The front panel has a rectangluar hole above the 2.4/4.8kc switch. Lettering is pretty worn around the preselector. Does anyone rework them? Or does anyone have one in fair shape.

so I guess next step is re-cap and re-tube it. Always wanted a Drake 2B and the 2A is almost the same thing. This one is a early one too, ser nu 135.

Jerry - NR5A - South Dakota

Hi George,

I just visited Sherwood's website and I couldn't locate any reference
to a Drake T4XC roofing filter mod. The only filter mod for a Drake
transceiver was the TR-7.

INRAD, however, has an upgrade filters for the R4C and the TR4,
nothing for the T4XC.

Where did you see the T4XC roofing filter mod on Sherwood's website?
Maybe I missed it.

How about using a Softrock module at the IF freq to get the
Panadapter/DSP features of a modern receiver. I have added these
modules to the Twin receivers and they can be installed on the
transceivers too. The Softrock module is cheap and allows the use of
a computer and sound card to get into the Software Defined Receiver
(SDR) techniques.

The SDR software gives better noise reduction, filtering and detection
for all modes of operation. The panadapter view of the band shows
what is going on around the frequency of interest. Key clicks,
splatter and other interesting artifacts can be seen on the screen.
Real time audio and the panadapter can be fed to the internet too.

Look at the yahoo group "Softrock40" for all kinds of info.

<http://groups.yahoo.com/group/softrock40?v=1&t=search&ch=web&pub=groups&sec=group&slk=1
>

Beware the dreaded wordwrap on the URL. If the URL is a bust go to
Yahoo groups and search for Softrock40.

1045. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-08-25 04:14:58 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 1045

All group memebers are welcome to post here on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others (what you put into this group you will get back so participate if you have a chance). Although we would like to focus on Drake Radio subject matter any Ham Radio subject matter is allowed. This includes any QST's of events or hamfests, especially if Drake radios are included

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our groups home page, as well as links to Drake information or your homepage.
Thanks to all members for your particapation.

Hello again
My TR7 was working fine. Next day nothing - no pilot lights, sound or anything. Nothing had been touched since the previous day when it was working.
Opened it up and found a glass cartridge fuse had blown. The fuse is situated behind the front facia top right.
I do not have a circuit dia. of the TR7 only the block in the handbook.So can anyone please help with a little bit more info about that fuse e.g. which circuit is it in and a likely reason why it has blown.
Don't just want to stick another one in and hope it works without knowing a bit more about it.
Cheers

Vic

Vic -

There is no "overall" schematic of the TR-7. I have attached a "block" diagram, which shows the "Parent Board" wiring that interconnects all the cards, controls and connectors. There are individual schematics for each card, and all are included in the Service Manual.

The fuse you found is for everything in the transceiver and power supply (control) except the PA stages. The fuse is a 5A fast blow. If it was mine, I'd try a new 5A fast blow fuse first. That one was 30 years old, and fuses DO fatigue and fail with age. If the new one blows immediately, then you have a problem. There is a polarity-protection diode to ground right after the fuse, which could be checked quickly. To tell you the truth, I've never gone looking for CR1, but it's an MR501 which is a standard 3A axial lead silicon diode. It MAY be on that terminal strip just above the fuse, but I don't have a TR-7 open to look at. Perhaps Gary Poland or someone else can point you to it. A simple ohmmeter check to ground would tell you whether it's shorted.

There are poor scans of the TR-7 Service Manual on the net, but the photos are useless. I got a decent CD version on E* for $10 from WB3CEZ, but there is no substitute for the real thing. A good original will run $40-50. There are two versions, the original is dated 1978, and there was a revised edition dated 1980 that is for s/n 6000 (approximately) and up, with the Version 2 2nd IF/ Audio board. The Version 2 manual has the original schematics as well.

Hi Mike

Thanks for the info. Just checked the link and spot on. Didn't like that bit about changing the VFO analogue lamp. Mine is flickering a bit so probably needs re-seating but going to give that a raincheck.

Would still like to know probable causes for that fuse blowing before blindly sticking another one in - the rig is too good to see it disappear in a haze of blue smoke!!

Thanks again

Vic

Hi Garey

Having opened the TR7 for the first time I quickly realized that I hadn't a clue what I was looking at. So, having found that fuse was blown I quickly shut it up again!!

Will check that diode to earth first (when I find it) and then try another 5A quick blow.

Thanks again.

Vic

PS. I honestly don't know who Gary Poland is. Perhaps he may feel inclined to help me if he subscribes to this site.

Gary is one of several excellent Drake repair guys who monitor this reflector. I'm sure any one of them knows where to find that diode. It's not on the Parent board itself, but is bound to be pretty close to the fuse. Doesn't do much good if it's somewhere else and connected via a wire in a bundle! :-)

It's in the +12VDC input line and only drives the receiver and low level transmitter stages, so would take a direct short to take it out. There aren't many individual components in there that could blow a 5A fuse "by themselves", without letting out a puff of smoke!

Topic: 1046 Message: 1052

A bit of a coincidence - one of my TR7's stopped working the other day after being in use daily for about a year and the cause was that same fuse was open. I inserted a new one and all has been well for several days again. Radio Shack sells a similar 5A fuse in packs of 4. When mine failed, I had no 5A fuses on hand so inserted a 4A and ran the rest of the day with that and no problems. Interesting comment about old fuses - I haven't had one die from old age before, but I can't find any other explanation for mine blowing.

Fuses wear out. This happens over time to expansion and contraction from heating/cooling.

Floyd -

ASSUMING the 18.1 MHz Band Crystal is on exactly 18.100 MHz and the Carrier Oscillator is on
exactly 5.645 MHz! Which is why the knob skirt slips! :-)

18.100 - 5.455 MHz = 12.645 Premixer

12.645 - 5.645 MHz (Carrier Osc) = 7.000

5.455 MHz

From: Victor Waddington
Topic: 855 Message: 1057

Hi
The good news is that I threw caution to the winds and put another 5 amp slow blow in and it's back to life with no smoke anywhere. Will see how long that lasts!
I was running the rig from 2 PSU's as the one I had was only 22 amp. So I bought a 30 amp job and ran the high current (PA's) from that and the low current from the 22 amp job. Worked fine. But the 22 amp one has given up the ghost and when I opened it up I found that it had no fuse in but had been jumped with a bit of wire soldered across it.
The voltage off load was fine but on load it dropped to two or three volts. I am not really surprised that the TR7 5 amp blew when the PSU had a girder for a fuse!!
Thanks to all for your help.
Vic

Topic: 1060 Message: 1060

This is a very nice looking SP-75, no scratches, plastic end pieces perfect. Only one problem - it doesn't work. The 459 KHz crystal won't oscillate (doesn't work in a test oscillator either) so we can be pretty sure it's dead. I've been unable to locate a replacement, so will sell this unit for $50 plus $8 for shipping. Email me if interested.

I have had excellent experiences with the Drake NB's in my R-7 and R-4C.
I am picking up a TR-4CW/RIT tomorrow at Shelby (no NB)and am looking
for comments as to whether the TR-4C blanker is as effective as the
other Drakes?

It was interesting to read Wayne Burdick's comments on developing the
Elecraft K-3 in that he said the noise blanker they investigated was
the Drake!

Dale -

All of the Drake noise blankers are essentially the same basic circuit according to Bill Frost, designed by a German engineer. There are variations in the active devices according to era, and some refinements such as the additional crystal filter section in the NB-7A. But essentially they all work the same way, i.e., turn the IF stage(s) off for the duration of a narrow pulse. They work best with very short pulses such as ignition noise, but as the pulses get longer the efficiency goes down.

Hello!

Well, it seems that lately all I get in my shop are Drake units with problems :-)!!!

This time is a T-4XC from a friend. It gives full power on TUNE (120W in 40m) but lots less in X-CW position... any hint?

Thanks!

JOSE (who has LOTS to learn about Drake units!)

Turn up the GAIN? May need to go to 2 o'clock for full output.

The GAIN (R105) control applies DC voltage to the Balanced Modulator to
unbalance it, and the Carrier Oscillator is shifted about 900 Hz (C177)
to put it within the passband of the LSB filter.

This seems to be a problem with the T-4XC. On tune mine gives full power about ten to but I have to turn the gain to about twenty past to bring it up to full power in the CW position.

Thank you Gary,

I just returned from Shelby- first year at their new location- very nice.
The TR-4CW/RIT looks pretty much new. Hard to believe how stable the VFO is from the get go.
The AC-4 has the new AC-4R upgrade board installed. So now I'll begin a search for the NB.

Not a "problem", just the result of two different controls on one shaft
that operate in two entirely different ways. One is an AF GAIN control
for the Mic Amp, and the other is a DC Voltage control for biasing diodes.

Another possibility is the T4XC is out of alignment and the final may need to be neutralized. I experience a similar output problem with my T4XC. However, after performing the alignment listed in the manual, the transmitter's output and tuning greatly improved. I now obtain full output at 2 o'clock with the plate at full dip and the load control set as stated in the manual.

If the AC4 can't provide the stable voltages and current the output will be affected.

Just a thought.

Good point Mike.

The ALC is active in the TUNE mode, and is the reason for the "topping out" of the GAIN control at about 10 o'clock. There is no ALC in CW, and so the GAIN control and output power are both capable of going higher. So if the stage gain(s) are down because of tube decline or misalignment, it's easier to spot in CW because of the masking effect of the ALC.

However, it is normal for the GAIN control to be advanced further in CW than in TUNE or SSB in a properly working transmitter.

Obviously, power supply problems can cause all sorts of transmitter anomalies!! :-)

Topic: 1070 Message: 1070

Hi
I'm following a 4B on Ebay. The owner doesn't know if it will work on 240AC as opposed to the U.S. 115v. So, were all Drakes made for dual voltage? I seem to think that they were and it could be switched by adding/removing a jumper on the tranni primary.
Cheers
Vic

Hello Vic,

Yes, the R4B has primary transformer windings for 120/220VAC. The
R4B's manual is available at one of the following websites.

http://www.dproducts.be/drake_museum/r-4b_manual.htm

or at the Bama mirror site at:

http://bama.edebris.com/manuals/drake/r4b/

The manual at the Bama website requires the DjVu reader which is
available at the same website link just scroll down and click on the
DjVu icon to download the DjVu free reader.

Thanks Mike

Never seen a R-4B so I thought it better to ask first. I do have the R-4C which has a switch on the rear panel to select voltage supply. Not sure if the 4B has the same facility.

Cheers

Vic,

I have an R-4C that has worked off both 115 and 230V. According to the manual for the R-4B, it is capable of working off both voltages as well. Some earlier Drake receivers were only designed for 115V - I once had a 2A that only worked directly off 115V. You should be OK with the R-4B - good luck in the auction.

Bob

W0BUX/G0BUX (thus the experience with both voltages)

I have my new rig and absolutely love it. The only oddity I have noticed is the inability to select LSB on 20M- not sure why I would want to, but I see no reason or mention why I should not be able to.
A quick (very quick) look at the schematic would seem to point to S1A. All other bands allow selection of U or L.

Trying not to reinvent the wheel,

Dale W4OP

Hello Dale,

Yes, S1A(F) and S1A(R), both part of the band switch, controls the sideband indicator lamps. Since the lamp issue only occurs on 20 meters, I would look closely at both switch wafers. One or both may just be dirty on 20 meters.

1081. FS: Unique Drake Service Supplement CDs

Date: 2008-09-07 14:43:01 UTC
From: Garey Barrell
Topic: 993 Message: 1081

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Looking for some info on where I might obtain parts (tubes, etc.) for a Drake R4B I'm trying to restore so I can use it as an external receiver with a TR4 xcvr. Where can I obtain the phono jack strip on rear panel, the ceramic inside the connectors are all broken. Also what can I use to clean switch contacts? I've heard that the cleaner from Radio Shack should not be used, so what is out there that is good. I also have a C Line that could use the switches cleaned also. Any info from anybody would be greatly appreciated.

I found this switch cleaning tip on the web at

http://www.wb4hfn.com/DRAKE/DrakeArticles/CleaningSwitches/CleaningSwitches.htm

and find it works much better than DeoxIt.

I've used it on 2 or 3 radios and am very satisfied with the results.

Another thing that will really help bandswitch operation is to carefully
remove its shaft and detent mechanism from the radio. Clean the dried
out grease from the detent mechanism and ball bearing, re-lube it with
a light application of automotive lithium-based wheel bearing grease,
then re-install in the radio. Your bandswitch will again operate as
smoothly and positively as factory-new.

Have fun!

Jim,

I have recently been asked to repair TR-4s that had the band wafer switches cleaned using Mark's method with Tarn-X.

The rotors of the switches have arced to the shaft and to the front and back sections and ruined the switches.

Looking at the composition formula of Tarn-X shows it contains sulfamic acid and thiourea which are mild acids. It looks like the Tarn-X was not thoroughly removed good enough and left behind a conductive path that arced when power was applied. The sandwich construction of the switch parts provides many crevices and blind corners for the acids to get trapped and the rinsing process can't remove them.

I see no reason to try to remove the "tarnish" from the switches as the cleaning process is harmful to the switch. Just the application of a tiny amount of contact cleaner such as DeOxit or Stabilant 22 to the actual contacts at the point where they touch is the best way to ensure proper operation of the switches.

From: Garey Barrell
Topic: 1082 Message: 1087

Dale -

Unless your switches are extremely corroded (white and/or green)
corrosion, stick with DeoxIT. Keep in mind that the purpose of cleaning
the switches is to make them operate reliably. Unless you are looking
to enter your transceiver in a concours exhibit for appearance only!!

The black sulphide coating which forms on unprotected silver surfaces is
very soft, and easily displaced by the fixed contact tension. If you
look closely at your switch wipers, you'll see a bright silver line down
the center of the wiper where the actual contact is made.

ANY silver "cleaner" or "polish" works by removing the silver sulphide
mechanically, in other words by removing some of the silver plating, so
any time you "polish" silver, you are removing some of the silver. Once
a layer of silver sulphide forms, however, the action essentially stops.

While the silver plating on switch contacts is very thin, you'd probably
have to "clean" them several times to actually remove enough silver to
expose the brass underneath. The real danger is the risk of damaging
the fixed contacts while poking around in the very tight quarters around
those switch wafers with tools of any kind. All it takes is to catch
the corner of a probe or even a few strands of cotton from a Q-Tip and
"spring" one of those contacts where it no longer applies pressure to
the wiper. Then you have a REAL problem.

A few drops of DexoIT on the fixed contacts to protect the exposed
silver surfaces is MUCH safer and just as effective _electrically_.

Thanks for the input Garey. I thoght you might have some feedback.
I was a bit warey of the Tarnex- having used it on metals (not switches in the past).
The DeoxiT has always done a nice job- so I'll start/stop with it and cue tip applicators.
Having seen the detent tab on a Collins mode switch actually wear away from neglect, I'll inspect/grease those areas also.

Hello Dave,

What smoked in your AC3 power supply? Unless the power transformer shorted internally due to an old dried out shorted filter capacitor etc.,, the supply can be fixed quite inexpensively.

Dale -

Yes, absolutely lubricate the detent mechanism of the rotary switches. Some use machine oil, but I prefer to work in a small amount of Lubriplate or other light, non-hardening grease. Also, it's a good idea to inspect all the switch assembly hardware. It does loosen over time, allowing the wafers to rotate off axis. You don't want to over tighten, it is small hardware and you can crack the phenolic wafers if you get too aggressive.

None of my kids or grandkids seem to be Ham Radio material. My youngest Grandson in Chicago, however, seems to have the "right stuff" to become interested. When we go to the R/C field for the air show, he watches the planes for a few minutes, then wants to go to the tents and shelters where the guys are taking their planes apart to repair, modify or change the batteries! Fortunately they are tolerant and willing to tell him what they are doing and why, which he just eats up........

Now for the favor.. His pre-school (he's four) class has a project to collect postcards from as many states as possible in the next month. I have filled out and sent a QSL card, which might spark some interest or questions from the group. It occurred to me that several QSL cards from various states might serve to show the class the spread of Ham Radio.

So... If you have a QSL, or even a postcard with your call written on it, Ryan and I would appreciate your sending it to

Ryan Bledsoe

Dale -

V6 and V7 do NOT need shields. The shell at the bottom is there just to screen the area below the plate of each tube.

No shields!

V11, V12 and V15 are the only tubes requiring shields, and they are all seven pin.

<kc9ys@...>

C-Line Main Tuning knobs are kind of hard to find, although the bright
discs are readily available from Charlie Talbot <pincon@...>

Be aware that the 7 Line knob looks identical, but is slightly
shallower. It will work just fine on the C-Line by moving the C-clip a
little further out on the PTO shaft. Charlie often has 7 Line knobs
available also.

1108. Bad cap on AC-3

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-10 20:10:40 UTC
From: David Rose
Topic: 1108 Message: 1108

I had my AC-3 for my TR4 go bad earlier this week and having today off gave me a chance to check it out. I found the problem I believe; a bad capacitor (chassis mounted standup) value 100 mfd @ 150VDC/80 mfd @ 350 VDC. The one on the supply is leaking oil, which would explain the "smell". I don't know if any can be gotten at a parts store so I figured it be worth my while to see if someone on the users group would have one. If someone can help that would be great.

Dave -

You can probably get a replacement cap from

<http://www.hayseedhamfest.com/capkit.htm>

Tom doesn't stock these, but can probably get one made in a week or two.

Most likely the rest of the electrolytics are not far behind.
Personally I think you'd be much better off to install the upgrade kit from

<http://www.sunlightenergysystems.com/theheathkitshop/page6/page6.html>

Dave -

Meant to mention in my previous message that Tom needs to know the size
of the original cap, i.e., 1" or 1-3/8" diameter can and maximum height
to be able to make you a replacement.

From: Jose V. Gavila
Topic: 1111 Message: 1111

Hello my friends,

Well, I have finally started to build a new page in my WEB, devoted to my TR-4C works. It has plenty of detailed pictures and comments.

Address is:

http://jvgavila.com/dktr4c_2.htm

Hope you enjoy it!

Best regards,

JOSE

Dave,

Good advise from Garey. I had the same one go on my AC-4 and I changed the whole lot out with the AC-4R kit from theheathkitshop. It also knock down some of the noise on receive. Now I do not have to worry about one of the caps going bad.

Hi

Also had same problem with AC-4. Wasn't able to get replacements so I changed the double for two single 100mfd 450v. Because modern caps are much smaller there is enough room on the chassis to lay them down instead of standup and then redirected the wiring. Replaced the other caps as well. Total cost about $18 and it works well although it looks nothing like the original.

But I would be interested to know how much the AC-4 upgrade kit costs.

If you are talking about the AC-4R kit, I bought a couple of them just some weeks ago. They were US$65 each + shipping

I had installed previously another one and they are perfect for the job and give a very professional look to the power supply. One of the last two is going to my AC-3 and the other one is already installed in a customer's AC-4. I plan to buy some more to put in my three AC-4s. As you can see, I like them :-)

Regards,

JOSE

Hello!

Thanks for your kind comments about my (under construction) TR-4C page (if someone missed it, it is located at: http://jvgavila.com/dktr4c_2.htm)

Well, I am in need of a couple 10m crystals, as one of them is of the wrong frequency and the other one is just missing. They are the 42.5 and 43.6 MHz crystals. Please, let me know if you have one or both available.

Thanks!

Dale -

The correct placement is 3/4" from the right, up 3/4" from the bottom. These dimensions are from the inner surface of the rolled cabinet edge, so would a little more (3/16") from the edge of the perforated front panel if you're doing it out of the cabinet.

Well, you were absolutely right!. It needs to be about "2 o'clock" to get similar power in CW mode than in TUNE mode.

So it was not a fault but a 'feature' ;-)

Thanks for your help!

Regards,

JOSE

Jose -

The reason is the GAIN control is a dual section, and the two sections act in entirely ways.

The AF portion of the GAIN control determines either the Mic Preamp gain or the level of the AF tone in TUNE mode.

The CW portion controls the amount of dc current applied to the Balanced Modulator diodes to "unbalance" it and allow the Carrier Oscillator to pass through.

Hello Jose,

That's great. However, does the maximum RF output occur at the same time as the maximum final plate current dip? If maximum final output does not occur at the same time the final's maximum plate current dip occurs, the final amplifier is not neutralized.

A final that is not neutralized will produce higher than normal plate current at maximum RF output which creates more heat in the final tubes, radiates spurious emissions, and shortens the life span of final tubes.

Just some thoughts.

Dale -

The Drake Noise Blankers are all basically the same circuit, the 9-NB, 34-NB, PNB-34, NB-4, NB-7 etc.

The 34-NB was for the TR-3/4 and consisted of the 9-NB and the NBK board along with the mechanical parts to add the control lever for the front panel. The NBK board was only required for the TR-3 and early TR-4 units with the soupcan or single can filter to match the impedance of those filters. Originally it was only available as a factory installed option. According to the 34-NB product sheet, it was included as standard in some versions of the TR-4, but I've never seen one "in person".

Starting with Version 7 of the TR-4, the front panel switch (lower right corner of panel) and the internal 9 pin socket were added to allow field installation of the 34-PNB.

The TR-4CwRIT moved the NB control to the push-button, and replaced the NB rotary switch with the RIT control.

Bottom line, any of the 34-PNB Noise Blankers (with the 9-pin plug on the bottom edge of the board) will work fine.

From: mater@concordia.psi.br
Topic: 1131 Message: 1131

Dear Friends, I am working in the restoration of a Drake R-4A. It would like to verify if anybody knows a possible way for the resolution of the following problem: When I power the radio the indication of s-meter is going to the end of the scale and stays (tension in the terminals of S-meter = 14,2V). A quite intense loss of sensibility of the receiver exists. I thought the problem could be in the section of AGC (Tube 13) even so the tensions are OK (1,3 V in the TP-2). I already try to find for any problem in several points, but without success... Can anybody help me?

Thaks in advance

Hello Alexandre,

Check the RF gain control setting. It may be set incorrectly which
will cause the S meter to read full scale.

Alexandre -

First be sure there is a shorted RCA plug in the MUTE jack on the back of the receiver.

Next is to verify the -80V DC supply, measure across C91, originally a black, tubular electrolytic under the chassis, back near the power transformer.

Since you mention an AVC "TUBE" you have either a Version 1 or Version 2 model.

The S-Meter circuit is a bridge, that compares the plate current drawn by the 1st and 2nd Mixer stages (V2 & V3), against the plate current drawn by the 1st and 2nd IF stages (V4 & V5). The 12BA6, and to a lesser extent the 12BE6 are both prone to grid emission (gas) and can cause the stage to draw excessive current and unbalance the bridge. So if you have spare tubes available, swapping these four out one at a time might reveal the troublemaker. If you don't have a spare 6HS6, you can sub a 6AU6A temporarily for this test.

If no spare tubes, you could start by measuring the plate voltage (Pin 5 on all) to see if one is unusually low. Should read approximately

V2 - 145V DC
V3 - 140V DC
V4 - 135V DC
V5 - 110V DC

If no luck, let us know!

Hi Jerry,

The 2A manual has a list of all the xtals and which sockets they go into.

I'm interested in obtaining xtals for 10 mhz and 18 mhz bands as well. I have built several qrp rigs, mostly xcvrs, and, want to build some more little transmitters to use with my 2A.

I have a list of xtal mfrs...

Mebbe we should put our heads together and come up with the best pricing on some HC6U xtals to give us these bands..

I wonder if there's anyone else out there with 2A's, 2B's or 2C's in doing the same???

Hello Jerry and Mike,

International Crystal in Oklahoma City, Oklahoma can provide the 2A crystal you need.

http://www.icmfg.com/hamradio.html

I purchased a replacement 40 meter heterodyne oscillator crystal for my R4C, 18.100Mhz, and the cost was $20 plus a few bucks shipping. Takes a few weeks to get the crystals but it's worth the wait.

Re your cabinet top search.

Just in case you are not aware, ALL the 4 Line separates R-4 / T-4 have the same cabinet top. The
early ones, (R-4 and R-4A,) were smooth semi-flat black while the R-4B and R-4C were a "spatter"
finish, and finally powder coated. But they're all the same mechanically. Might be able to widen
your search a bit.

Hi Garey,

Yes I know the cabinet sizes are the same with the R4 and T4 <any's>. Whether the paint is powder coated or not is, to me, not important. I can have it repainted. I've been considering selling my Kenwood TS-820S and VFO-820 in hopes of picking up a nice TR-4 or TR-4C and AC4 supply. Haven't decided yet whether to do that or not.

Thank Garey for the info. Always good to be reminded of things one forgets as we get older.

Hello Jerry,

You can download the 2A manual at the following website. You will need the "DjVu" reader to view the files. The reader can be obtained at the same website, free. Just scroll down and click on the DjVu reader icon and download and install it.

http://bama.edebris.com/manuals/drake/2a/

I recommend downloading the 2A manual from the above website and read starting on page 10. Page 11 give a list of every possible crystal frequency for every possible band you may want to receive.

1149. T-4XC OUTPUT PROBLEM

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-16 14:22:53 UTC
From: tnham63
Topic: 1149 Message: 1149

My T-4XC has developed a problem.
Low output on 80/40 and 20m in the XCW position.
But in the TUNE position it is fine.
I did a re-align and peaked the output on inj and trimmers, but
this is all I get.
40m TUNE 140 W XCW 90/100 W
80M TUNE 140 W XCW 100 W
30M TUNE 150 W XCW 150 W (THIS BAND IS FINE)
20M TUNE 140 W XCW 100 W

This is with the XMTR GAIN control wide open . It used to
put out 140w on all bands now, just 30 meters..

Any ideas?

Thanks
Wink

Hello Wink,

You said you did a re-align and peaked the output on inj and trmmers.
Did you perform any additional alignment adjustments other than the
RF and Injection trimmer adjustments?

A complete alignment consist of more than just adjusting the RF and
Injection trimmers on the left side of the T4XC. Aging components,
including tubes, can affect the overall T4XC alignment which will
ultimately contribute to a change (reduction) in the final
amplifier's output.

Have the final amplifier tubes been replaced recently? If so did you
check the final amplifier to see if it needs to be neutralized? The
level of output from the final amplifier will be affected if the
final amplifier is not neutralized.

The key is for maximum final amplifier RF output to occur at the same
time that minimum plate current (dip) occurs when adjusting the PLATE
control. If you adjust the PLATE control either side of minimum plate
current in TUNE or CW mode and the output increases significantly, 10
to 20 watts for example, then the final needs to be neutralized.

Hi Mike -
Yes, Neutralization is fine -- The finals were
relaced about 2 years ago and, I still get
full power out on 30meters.Also changed the Driver tube.
I guess some component has changed value but I don't
know where to look.

Hello Wink,

Although it's a good idea to initially check/substitute tubes, tubes are not always the source of problems. I recommend performing the resistive and voltage checks on page 5-4 of the T4XC's manual. These checks can possibly point you in the right direction or to the stage that may be causing your problem.

Another area that contributes to these types of problems are dirty switch contacts (band switch for example). This is common with vintage gear.

1153. Re: [DrakeRadio] Re: MS-4 Logo PLacement

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-17 18:44:33 UTC
From: Garey Barrell
Topic: 1123 Message: 1153

Dean -

When this question was originally posted, I looked at the one on my desk
that I knew to be "original" cause I bought it new in 1965. It measured
3/4" up and 3/4" from the right side so I said that was "correct".
Then your message came up and said that yours was 3/4" up, and it was
only 5/8" in!! So I walked over to the shelves and measured three more.
ALL were 3/4" up, but they were 1/2", 5/8" and 3/4" from the right side
respectively!!

Well, now we have two measured as 3/4" in, two measured as 5/8" in, and
one as 1/2" in. If I was producing them, I'd have an "L" shaped guide
that was aligned with the lower right corner of the panel, spot on some
glue, and fit the badge in the corner. I would have guessed 3/4" and
3/4" for the design goal. It looks good. But perhaps Drake only had a
3/4" strip or ruler along the bottom and the horizontal placement was by
eye? Or since I "know" my 3/4" unit is "original", that's correct and
the others have been removed and re-installed over the years?

Or, and this is most likely, we're all just nuts for worrying about
something like this!

Nahhh, that _couldn't_ be it.........

Wink -

Mike has had some good suggestions.

Do you get the same results in TUNE mode in both USB and LSB?

I would suggest checking R44 for value and condition.

The GAIN control in CW mode applies a DC current to the diodes in the Balanced Modulator to unbalance it and let the carrier oscillator signal through. This current is supplied via R104, a 2.2M resistor. This resistor is prone to increasing in value, limiting the current that can be applied to the BM.

Hello!

I have three MS-4... and each has the label at a different horizontal position!. Looking at it, I guess they just put the label tangent to the third hole row, upper part, and then, 'more or less' about 12mm from right side.

All in all, not a great deal... but we are this way ;-)

Well Garey,

You got me thinking, so I went and checked mine out. One is 3/4" in by 5/8"in and the other is 3/4" in by 1/2" in. So where do we go from here? It look like 3/4" in. in is standard but the height can vary from 1/2 to 3/4" in.

Were these TX and RX converters ever used on the TR-4 series? I seem to recall the conversion on the 4 line separates was a bit involved but don't ever recall the possibility of them being used with the TR-4.
BTW, Currently, there is a TR-6 with CW and AM filters + NB being advertised on QTH if anyone is interested.

Dale -

Yes, the VHF converters were used with the TR-4 and TR-4C.

Drake offered a kit for the TR-4 that included a plate for the "open"
area at the back of the TR-4 to mount the six phono jacks required.
It's just a flat panel cut out to fit over the left side of the
chassis. The TR-4C already had a panel installed in this area, punched
and marked for the conversion.

It's not a particularly difficult mod to perform, essentially just
disable the screen supply to the Final, tap a small amount of 20M RF off
of the Driver stage, and couple the converter output to the receive antenna.

I have a copy of the mod instructions on my TR-4/C CDs or can send them
to anyone who wants them.

Hi Garey,
I was driving myself crazy- because I knew I had seen a Drake VHF Mod somewhere, but could not find it on the Internet.
When you mentioned your CD- it was obvious! Thanks for the reminder. I guess now, the most difficult part will be finding a TC-6. I've seen SC-6's and even owned one (may still), but I don't ever recall seeing a TC-6 in captivity.

73,

Dale W4OP

Garey -
Yes same results in TUNE LSB and USB.
I have located R44 and R104 (thanks to your CD)
And I will try to test them this weekend.

OK guys, here's the _REAL_ answer!!

From our friend Bill Frost at Drake. (Still!) :-)

"""""""

Hello Garey,

NEWS FLASH !!!!

I was talking to one of the guys here and mentioned our conversation about
the MS-4 name plate placement. He said "I'll ask my wife, she was on the
MS-4 production line and put on the name plates", so he called her and ask
how she put on the MS-4 logo. She said they just tried to get it squarely
in the corner, they didn't use a gauge of any sort.

So, depending on the vintage and the girl that was putting on the name plate
and her frame of mind ....

73, Bill

"""""""""

One more mystery resolved....

1164. TR7 Weak RX

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-19 17:07:08 UTC
From: Al Scanandoah
Topic: 1164 Message: 1164

Hi

I'm new to the group, and decided to join after acquiring a TR7 in rough condition.

For now, I'm just trying to get the RX going. I'm seeing sensitivity on the order of -80 dBm. I injected the same level signal to the input of the up-converter board and got the same result, so the path from the rear panel is OK.

I can inject less signal into to input of the the IF filter board, and the signal is rock-solid, so it looks like I'm losing ~45 dB somewhere between the input of the up-converter and input of the filter board.

Has anyone experienced anything like this? If so, to what was the problem attributed?

Crit -

From another 99% CW op....

You would be _***MUCH***_ happier with a good B Line pair. The B Line pair has four selectivity positions and a Noise Blanker standard. It has L/C filters which I prefer for CW, UNLESS you want to operate during a major contest on the low bands. A C Line pair is good too, but needs at least the (optional) 500 Hz filter. The NB is another (expensive) option for the C Line if you need/want it.

in my opinion, NO transceiver of that era was a "good" choice for CW. The TR-4CwRIT comes the closest. RIT is a must.

Either setup will work best with an AC-4 Power Supply.

The TR-7 does a good job, but is better still with the R-7 in transceive. And is a solid state product. It's one of the last "repairable" solid state transceivers that uses second-source parts throughout. Again, filters other than the standard 2.3 kHz are optional, as is the NB.

Crit,

I echo the sentiments of Gary that if you can get a T4XB/R4B combo you will simply enjoy working either cw/ssb with it. I have a Drake C Line that I have had for 20+ years and would not ever consider parting with it. I also have a TR4/RV4 xcvr and am planning to restore a R4B rcvr to use with the TR4 as an external rcvr. On most of these rigs, the AC4 p/s is best suited. If you look on QRZ.com, QTH.com or E-Ham.net you will see for sale any of the combos you have spoken of. Again like Gary has stated, the R4B has great filters and the noise blanker built-in where the TR4CW w/RIT or R$c rcvr do not and they are expensive even if you can find one. I've attached a couple of photos of my Drake hear. Good luck in your search for what I consider to be the best amateur equipment ever made in the Us.

Greetings to all,

I'm a newbee here, and I want to thank the moderator for approving my request for joining the Drake group.

I'm in need of both manuals (op/serv) for a Drake TR-7A rig that I'm trying to get back on air, this rig seems to be very solid in its constructions, except for those crazy flat head screws(geees a pain in the but to get started)

It has a faulty PSU and the display starts out crazy like 53.815.0 when it should be 3.815.0 then it settles down and show 3.815.0, then if I change to the higher bands
like 10,14, or 28 MHz it only shows the secone MHz digit, for example 0 for 10 MHz, 4 for 14 MHz, and 8 for 28 MHz, the band switch is also intermitant, I can fix that easy.

1181. TR7 Weak RX - Update

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-23 16:41:24 UTC
From: Al Scanandoah
Topic: 1164 Message: 1181

The problem turned out to be the double-balanced mixer module.
Luckily, I had an SRA-3H in the junque box to at least get things up
and running. Now I'm pondering whether I should buy the correct mixer
(SRA-3MH+) or modify the LO to increase the drive to the '3H. Either
way, performance should be better than with the original mixer.

Al, K2ZN

1182. Looking for TR-7 Filters

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-23 16:43:21 UTC
From: Al Scanandoah
Topic: 1182 Message: 1182

Yes, I know I can purchase them from Inrad, but I figured I'd ask first. Does anyone have a 500 Hz CW filter and either a 4 or 6 kHz AM filter that needs a new home?

73 - Al, K2ZN

Hi Don,

Thanks for the link to the manual for the TR-7 is it the same for the TR-7A?
I suposed it's almost the same.

From: Garey Barrell
Topic: 1178 Message: 1185

As usual, there is a LOT of misinformation on the internet..... For FREE!!

The Operating Manual is about 40 pages and there are several decent scans at various manual repositories.

The Service Manual, on the other hand, is almost 250 pages, with about 10% of them 11 x 17 size or larger. The "FREE" scan copies that I have been able to find, are the typical low resolution with blocked up photographs that are useless for service.

Obviously, just photocopying the Service Manual would easily run $30, (unless of course you can steal the use of your employer's copy machine,) and just scanning (or copying) the entire book would be a half-day project. Even printing out the CD at a copy center would cost well over $30.

I did find one decent scan on CD of the Service Manual on E* for $12 from WB3CEX. Even that one had all the oversize sheets displaying upside down in the Reader, but at least the photos were clear, aside from the Moire patterning caused by not using (or having) a 'descreen' filter.

Original Service Manuals show up often on E* for around $50, and are well worth the cost if you want a usable manual. It's hard to understand that someone would pay $600 for a piece of equipment and then think they should get service manuals for free.

By the way, there are two versions of the Service Manual, covering TR-7's below or above about s/n 6000

about the only difference will be that that the TR7A will have all the filters adn such and the later sn# tr7 2nd ver board
otherwise, its the same.

1197. L-4B PROBLEM

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-28 18:31:35 UTC
From: Walter Milton
Topic: 1197 Message: 1197

All,

I know have my Drake L-4B up and running but I'm experiencing what maybe a problem or not. After I get the amp tuned up on a band I noticed that when the AGC/Standby switch is pulled out. I lose receiver sensitivity. Is this normal? There is a soft key mod in the RF deck. Does this have anything to do with the lose of sensitivity. After transmitting if I push the switch in receiver sensitivity returns. Is this normal for the L-4B?? The amp operates as it should other then the receiver sensitivity lost. Has anyone experienced this problem and or know of a solution.

Thanks in advance,

Thanks Garey -- It was R104 the 2.2 MOHM resistor.
Replace it and now I get full output. R44 checked OK
at 687 ohms..

Thanks again for your help.

1199. L-4B PROBLEM

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-28 20:35:38 UTC
From: Walter Milton
Topic: 1197 Message: 1199

All,

Some updated information on the problem I am experiencing with the L-4B. After turning the unit on and waiting 3 minuets. I notice that when I pull the standby switch out the plate amp. Meter needle moves from zero (0) to 0.1 amps and the receive sensitivity drops. Is this normal operation for the L-4B? When the standby switch is pushed in the meter returns to zero and I have full receive sensitivity.

Again thanks for the help and suggestions.

Pull the relay control cable. You have a short in either the cable, or in the transmitter. What you are seeing is the idling current.

One other thought, if you are using the two pin original Drake plug, reverse only one end of it. All the relay control does is take one side to ground, and with the plugs not matching, you will get the results you describe. The loss of receiver sensitivity is because the antenna relay in the amp is open in the transmit condition.

Mike,

Yes, I am using the original two pin Drake Plug. On switching the plug and pulling out the standby switch .. All is as it should be. THANKS that fixed the problem.

Glad to be of help. I marked the plug on my amp as to which side is ground.
Makes it simple when for some reason I need to disconnect the amp.

Wink -

The best "subs" are a 6HS6 and a 6EH5. Both are readily available from many tube dealers, although the 6HS6 has become pretty pricey. It was a very "late" tube, and as a result was not made in the huge quantities of the earlier types. It is an excellent mixer, and really sets the performance of the receiver. You only need one, bite the bullet. It should last the rest of the life of the receiver.

That said, the 6AH6 is a reasonable sub. There are a few other tubes that are as good as the 6HS6, but they have a different base and so would require some rewiring.

The 6EH5 is a tube with good output at low plate voltages. Again, there are some equivalents, but not with the same basing. But this tube is plentiful and cheap, so no reason to sub.

Date: 2008-09-29 21:15:58 UTC
From: v44kai
Topic: 1209 Message: 1209

Hi to all,

First I must say thanks to all on the group, for helping me find the manuals I needed for the TR-7A, especially Garey, who sent me the schematics I needed that were missing from the service manual I downloaded (that what you get in the free world, take what you get, it's free hi hi).

Just to update all, I started work on the TR-7A, thus far I have soldered most of the joints associated with D1 and make a few IC swaps and, changes those that I have in stock. The results are the same.

I also switch Q9005 and Q9006 collectors ensure that D1 is good, the result was D1 is good except segment (e) is no good (I don't think that will matter much, does it!).

I also realized when I put the counter switch to EXT, instead of getting six zero's I get 90000.0 (because segment (e) is bad) but is really 80000.0 In this mode all the digits changes except the left-most one. (This the way it was before I started working on it).

This may put a twist on my problem, to those familiar with repairing this rig.
All suggestions are welcome.

1210. R-4A audio Stage Problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-30 00:08:38 UTC
From: captcurt2000
Topic: 1210 Message: 1210

Good evening guys. My trusty old r4a has developed anissue. pretty much all original (tubes even). I recently paralleled caps for the PS since it is old. I've been using it lately and it seemed fine except for a low level 60Hz hum comming thru the audio with no difference from the level control or stby, etc. I went in again and checked all of the small electrolytics and they all checked good but I replaced them anyway. The 2 10uF-25V in the audi amp stage and also the 8uF -bias supply.

When I was done, I re-aligned the sensitivity and S meter zero and buttoned it up. Now the audio is weak and the 6EH5 has a red plate. I've double checked the three replacement caps several times, replaced the tube, and checked all the voltages. They all are very close to the chart.

It really resembles an un-neutralized final the way it is running. A scope shows nothing strange on the cathode, and the signal is there like it should be and controllable. When I scope the plate side however, there is a very large AC signal there regardless of input. It is several volts and roughly triangular. There is also a very large RC-type triangular ripple on that section of the PS.

ITs like the tube is oscillating at 120hz but that is not translating to a loud output--so it is just in the plate side???

The primary winding of the output transformer measures about 240 ohms. and the feedback cap is good.

Anyone seen this before? Any hints?

Thanks and Regards.

Curt

You can also sub 6AU6A's I think. Heathkit did this in their later versions of the SB102 and similar Heaths, a common sub for the Heath was the 6HS6...lower noise level, great for mixer circuits..that was the big reason in the S/N improvements from the SB-100 series to the SB-102. etc....but check the schematic first to see if the circuits are similar...good luck

Thanks Andreww:

Nope..all of the tube DC voltages look fine--0 on the grid, 3.5 on cathode.

I've put everything back the way it was now ex for the 4 main PS electrolytics.

Doesn't seem like there could be a huge current draw event going on to make the plate glow red and still keep the cathode voltage correct across the cathode-to-ground feedback/bias resistor.

I'm kinda stumped at this point.

Suggestions welcomed.

Curt -

You're missing something.... We _assume_ you have subbed another 6EH5!? IF there is 3.5V on the cathode, and 0V on the grid, a good tube "should" be operating with about 40 mA of plate current which is about right for Class A operation. The fact that the plate is red under these conditions says that the current is NOT going through the cathode. The power is not being coupled OUT effectively. The other problem is that R43 is marginal, and will not support much over the expected Class A current. I would suspect a short in the output, possibly C175 or a shorted output transformer, primary or secondary.

check the plate voltage , if it is 0 the screen will take all the current and will be glowing . another possibility is that you just have a bad tube .

1219. TR-4C Front Panel?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-09-30 21:26:08 UTC
From: DALE PARFITT
Topic: 1219 Message: 1219

I am restoring a TR-4C and although the rig is in pretty good shape overall, the front panel has a nickel sized spot where it is corroded. Does anyone have a spare panel? I know I can buy the repros, but this rig is not my keeper rig, and as such, I would prefer not to put that much money into a panel.

Tnx,

Dale W4OP

Alright--I guess I'm feeling kinda stupid tonite. After looking at all the voltages, measureing resistances, and calculating currents and tube power for the plate screen and cathode, I figured I must be looking at the tube wrong. I saw the cathode sticking up at the top center of the tube and it is sure glowing red--suspect it is supposed to. All of the other measurements indicated that the tube was drawing about 35ma. Like Gary said, this is right where it is supposed to be. I believe the low output was a degraded First IF amp--replaced and it is where I expected it to be. So all the PS caps are done, along with the tubulars in the audio section. Still has that annoying hum regardless of audio gain setting.

I had replaced the 6EH5 BTW.

Itouched it and was shocked at how hot it was--thats when I saw the red element and thought the tube was running away. Oh well, live and learn I guess. I appreciate all your suggestions.

Still would like to get rid of the low level hum. Not sure what to do at this point. All the caps are new--although they are all individual radials munted under the chassis instead of a 4x can.

I wonder if a choke would be a good addition to the PS? Not much else to try. I can see nearly a volt of ripple on the 160V feed line.

Anyone have an idea what a good one looks like ripple-wise?

Anyway, thanks and its back up and running.

what you are seeing is the tip of the filament and it is normal for it to be glowing red , will check the 2B and see what it's ripple is (I know they are not the same radio but it is the only drake receiver I have) and let you know what I find . audio power tubes will get hot enough to raise blisters .

Thanks Andrew:

Well yes the filament is sticking out the top but that wasn't what I was noticing.. It goes down inside a small oval cylinder and I guess that is the cathode--that is glowing red as well--nearly as red as the filamnet.

Yes, the 6EH5 does run hot. It WILL burn your fingers if you don't let go soon enough.

About a volt of ripple on the +160V DC is about normal. What is the serial number of your receiver?

OK, that's a Version 4 model. Your hum is most likely coming via R136, C172, R137 and C173. These are the decoupling network for the two audio preamp stages, Q7 and Q8, both of which are "behind" the AF Gain control. Replacing or increasing the value of C173 will reduce the hum. There should be NO ripple on the Collector supply for those two stages. You can also reduce the value of C167 to roll off the low end if the hum is still objectionable. This all assumes you are using a speaker. Hum with headphones is a different subject.

Thanks Garey:

That makes alot of sense..I'll check that out. Someone also suggested a possible short between cathode and filament. Didn't check for that but not sure if I actually listened to it with the second tube in place or not.

Why is it a different issue with headphones?? Comes from the same place? Is it just a level issue?

I do use headphones alot 8Ohm variety, and it is quite noticeable and it is barely noticeable on the Drake speaker. Some other speakers are worse or better. The hum is generally below the noise threshold but is showing up when I use the audio interface to SSTV and PSK31.

Thanks Again,

Curt

Curt -

Typically, a heater-cathode short gives quite a bit of hum, not just a little!

There are two types of problems with phones. One is the use of Hi-Z phones, which are VERY sensitive, meaning the AF Gain control ends up very near minimum, where the S/N ratio of the AF stages is poorest. Consider that the AF stages are all running at maximum gain, and volume is controlled by limiting the input signal level. Here the answer is a series resistor to enable you to run the AF Gain control up to at least 10 - 11 O'clock where the S/N ratio is considerably better.

The other problem, which shows up with Low-Z phones such as your 8 ohm variety, is that these are typically "Hi-Fi" phones, designed with extra bass response for music reproduction. "Modern" music and its' audience prefer heavy bass response, exaggerating whatever hum may be present. They are also considerably more efficient than a speaker, causing you to again run the AF Gain very near minimum, further exacerbating the S/N / hum situation. About all you can do here is insert a high-pass filter to roll off the low end below 2-300 Hz and/or insert a pad to at least enable you to turn up the AF Gain to get out of the S/N problem.

Got It!

Thanks again Garey for the considered and detailed responses.

It is interesting that the usual problems associated with older
tube-type equpment/analog VFO for PSK and SSTV is the frequency
stability and quality of output. None of that here. These things are
rock solid--Giving me IMD checks internally of -40dB. I'm thinkin
I'll keep 'em around a while! ;)

Thanks again to all,

Curt

1231. Drake HF & VHF Station For Sale or Trade

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-01 21:02:02 UTC
From: hummerham
Topic: 1231 Message: 1231

I have a Beautiful Drake HF and VHF station for sale or trade. This entire station was completely restored by WA8SAJ, ("Mr. Drake") Jeff Covelli. All pieces look and work like new. The station consists of:

T-4X
R-4A
AC-4 p/s with new board from the Heath Kit store.
MS-4 speaker
MN-2000 tuner
W-4 watt/swr meter with PEP mod
Shure 444 mic
(again all these restored)

Rare TR-6 6 meter transceiver (still has some pitting on chassis)
MORE Rare RV-6 remote VFO
AC-4 p/s with new board from the Heath Kit Store
MS-4 speaker
W-4 watt/swr meter (calibrated for 6 meter)
Shure 444 mic
(all restored)

All with manuals & restoration docs. $1200 shipped for the HF station, and $2200 shipped for the six meter station. I would prefer to trade both stations for a TEN TEC OMNI VII. I don't want to split the pieces up at this time. Look up my call on QRZ & check out the pic of this station. Please email offers. Thanks & 73....Butch...K3AFR...k3afr@...

1233. TR-7 Card Puller

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-02 12:49:36 UTC
From: jch39_99
Topic: 1233 Message: 1233

Well, I got my TR-7. Made CW contacts on 40, 30 and 20 meters (had to cut the trace to allow all frequency transmit). I am impressed. Boy did they pack that radio (my Omni VII has all sorts of empty space inside its cabinet which is roughly the same size).

Now in reviewing the manual I notice they mention a "card puller supplied with the radio." Of course, there was no card puller supplied w/ this radio. What are folks using to assist in pulling cards? And are card extenders still available?

W7AVK had had made up a batch of the extender boards and is where I got my set, they worked well,
though i did have to file down the edges as some were a tad bit too wide. I just tried to bring up his web page
though and it wouldn't come up. so i do not know if he is ok, or has any left.
they also come up for sale on ebay on occassion.

The card puller can be fabricated from a length of wire coat-hanger. There are two SMALL holes at the top of the cards. The "almost official" card puller is a rectangular shape the width of those holes. The ends are bent down a couple of inches, and then a small right-angle bend to engage the holes.

The extender boards are available from W7AVK. I just saw something recently about a new website, but you can see the information at

<http://incolor.inebraska.com/jshorney/tr7ext.htm>

There is also a photo of a "card puller" there!

Bob has email at <w7avk 'at' arrl.net>, or at <rolfne 'at' atnet.net>

His board set is very well made, and about half the price the "real" sets sell for "used".!

1240. Feelings on upgrades? Yes or No?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-03 13:19:09 UTC
From: captcurt2000
Topic: 1240 Message: 1240

Good Morning folks:

I'm considering a few mods/upgrades to my Drake system. Now I love my R4a and T4x just the way they are but there are a few things I would like to consider. Solid state adio amp. fans. an external freq readout. an external sdr pan adapter. A way to monitor the transmit agc level. And of course, the installation of new caps.

My question is this? are there two camps out there regarding any mods at all? Like an all original 67 corvertte?? All original R4a? or is the thought that if I can improve it, I should.

Now my twins are not pristine. They have moved around the country with me for many years. They have been stored in less than ideal conditions. They work as new or close tho, and have nothing other than new caps added--no cutting or other drilling, etc.

I've considered getting a couple of fixer-uppers to modify and be my "daily drivers" but not sure if I just might go ahead and mess with these. I don't think there is any financial advantage one way or the other--not sure we'll ever see the multi-thousand dollar level that the Collins S-line stuff has gotten to--even considering we have equal or even better performance. (S-line is certainly built better as it wasn't marketed to the same price point)

Anyway, I'd love to hear your thoughts on this.

Curt

Curt -

It's a matter of personal preference, and WHY you use Drake gear.

Personally, I use Drake gear because I like the way it's made, the way it operates and the ease of repairing it. I have just about all the 4-Line models (and 2 and 7 for that matter!), and have no desire to _modify_ any of them. Now if I had only ONE station, and wanted it to be the best I could make it, then yes, there ARE improvements that can be made to any unit. After all, the NEWEST one is 30 years old! That's a century in "electronic years", (kinda like dog years!).

To take your possibilities one by one....

Solid state audio amp. There is NO IC audio chip that produces audio anywhere near the quality of a Class A tube amplifier. While I'm certainly not a "high end" audiophile who has to have a $20,000 amplifier with a gold chassis and push-pull 12AX7 output stages, there is just no way a solid state amplifier can improve on a Class A tube audio amplifier. For low level audio stages, a single transistor in Class A operation comes close, as long as it is not overdriven, but "totem-pole" or Class B output capable of a few watts (most IC topologies), no contest.

I don't consider a fan as a modification. A fan is probably the single most important "accessory" for just about any power amplifier stage putting out more than 50W. It doesn't have to be a wind tunnel, just a gentle flow of air _OUT_ of the final cage to encourage the natural convection and move the heated air away from the general area.

I don't see any need for an external frequency readout. Just when do you need to know your frequency closer than the 0.1 kHz accuracy / resettability of any of the Drake analog dial radios? About all digital readouts have done for Ham Radio is to cause people to call CQ on even kHz frequencies! How many hours have been wasted arguing over what frequency two or more Hams are on?? "I show us on 14.325.01", "no, we're on 14.325.012", "well MY rig says we're on 14.325.008", ad nauseum. Even worse, they're often _actually_ on 14.0324.5, and haven't calibrated their "master oscillator" since it left the factory!

An external SDR is an interesting experiment, and a modified Softrock "receiver" is a fun project. Certainly inexpensive and a lot of possibilities. But this is more a case of taking the "front end" of a receiver and converting the "back end" to a computer, than a "modification". This is a complete redesign! Kinda like jacking up the ignition switch on a Corvette and running a Jeep underneath it. Or putting a "Hemi" into a Jeep!

I'm not sure WHY you'd want to measure the transmit AGC level, but... Unless you just like watching meters while you talk. Assuming the AGC is doing its job properly, (easy to determine with a scope, which is the ONLY way to be CERTAIN of your signal quality,) what difference does the "level" of AGC make?

New caps are a matter of either repair or preventative maintenance, not a modification. If the electrolytic caps in the power supply filter are originals, they are almost certainly bad now, or will be fairly soon. Usually they fail by drying out, causing the ESR to go up, ripple reduction to go down, and HUMMMMMMM. But every once in a while, one will SHORT, which hopefully will blow the _correct size_ line fuse before the power transformer smokes. If someone has wrapped foil around the fuse, or inserted a piece of #00 copper wire (I actually found this in one...) it could make for a very bad day for the equipment, and its' owner.

Bottom line, it's YOUR equipment, and YOUR decision as to what to do with / to it. Personally, I prefer to keep it as designed, warts and all. I also have a TS-940SAT as my "modern" rig, and so far have not seen anything newer that surpassed it for making contacts on the Ham bands. I have no need for pan-adapter screens, CW "readers", a picture of the other guy, or tiny buttons that require a stylus to press less than three at a time and take a two-inch thick "quick-start" BOOK to describe how many times to push each button for six level menus!! :-)

Yes, you can put a Jaguar V12 engine in a Mini-Cooper (with a little judicious metal-work!), but what you have then is neither a Jag - NOR - a Mini-Cooper.

1244. R-4 Problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-04 13:22:03 UTC
From: tnham63
Topic: 1244 Message: 1244

My R-4 works great on 80/40/30 mtrs, but on 20 there
is now noise level. Another receiver shows band noise
at S5 but on the R-4 0. Some sigs pop up on the S-meter
but the low noise floor is weird. I have tried peaking
the trim caps but they are already peaked.
Any ideas ???

Tnx
Wink

Hi Garey:

Thanks for the input--can't say I disagree with any of it, but one thing has me wondering.

How do you read 0.1kHz frequency from a dial that has 1 kHz marks (except right at the even kHz)and the linearity of the system is 1 kHz off in 100??

I understand that it is rarely, if ever a real issue knowing exactly what frequency were on but, it is often nice to be able to get precisely BACK to a previous freq. My old eyes, especially in a dim radio room might enjoy the break of having some .500 height numbers :)

Thanks again.

Curt -

Fair question.... :-)

You have marks that are almost 1/4" wide. With the R-4A, you have accurate calibration markers every 100 kHz. So.... You set the dial to "0" at the "nearest" 100 kHz mark. Then you use a procedure known as "interpolation" to _estimate_, (or visualize,) the halfway point between the two marks. That's a half-kHz. Then visually divide that in half, or into five (!). With a little effort, you really CAN reset a dial of this type to well within 100 Hz, certainly close enough that you will hear whoever you are looking for. When you get your digital readout, try interpolation and I believe you'll be surprised just how close you can come!

By the way, the little TXCOs used for most of the digital dials have a stability specification of +/- 30-40 Hz at 14 MHz, so that last digit isn't too reliable! There is often a BIG difference between "resolution" and "accuracy".

My real point is that as Amateurs, we have no real need to be within 100 Hz of a _specific_ frequency, other than to be able to find another station. Unless like some you just like to argue how "your" frequency measurement is superior to someone else's! :-)

I have to admit, I cut my teeth on a BC-454 surplus aircraft receiver in 1956, and the entire Novice band of 50 kHz was between one cal mark and a scratch a little more than 1/8" away! So I did develop a "safe-cracker's" touch with the tuning knob. I also used calipers and micrometers professionally for years, where interpolation was a constant practice.

Again, purely as a matter of "old eyes", or merely wanting the "warm and fuzzy" of seeing that bright red 14.025.45 on the dial, it's up to you! :-)

OK FB Garey. I'm with you. Yes I can put it within a 1/4 of a division. I'm an old gage builder so used to the vernier on height gages and mikes too. Ran a ISO calibration facility for a while also--thats probably why I can't see any more!! :)

I do it just like you describe plus put in an offset based upon which 1/4 of the 100kHz non-linearity segment I'm at so can get it pretty regularly to 200Hz I guess or better.

Thanks Again, and have a great weekend. I'm havin some fun on the TARA RUMBLE PSK31 contest today.

Hello

There is a rubber (or some similar material) bushing on the shaft that maintains pressure between the knob and dial skirt. Unfortunately, the bushing on my rig is dried up and ready to disintegrate.

Any ideas as to what to use as a replacement bushing?

Al -

The original in the 7 Line was surgical natural rubber tubing. It was originally soft and a translucent, amber color, but the years do not treat it kindly. It gets hard, and a dark almost red color and crumbles. It is 5/8" o.d., and 3/8" i.d., or at least it used to be! :-)

Some have replaced it with automotive heater hose, I have used clear vinyl hose from the hardware store. Surgical tubing might be available from a surgical supply place, but telling them you only need a half-inch length may be troublesome! The 4 Line used a much harder vinyl tubing that seems to hold up better. Again, all that is needed is a slight compression to give enough friction to drive the dial gearing.

The best way I've found to cut it is with an X-Acto hobby razor saw. The ends need to be square since that is where the friction driving force is applied, and I tried several different scissor type and even blade and anvil pruning shears, but all deformed the shape, leaving a "pinched" end before cutting.

The Main Tuning knob is pressed in while tightening the set-screw to compress the tubing slightly.

Subject: [DrakeRadio] Feelings on upgrades? Yes or No?

Good Morning folks:

I'm considering a few mods/upgrades to my Drake system. Now I love my R4a and T4x just the way they are but there are a few things I would like to consider. Solid state adio amp. fans. an external freq readout. an external sdr pan adapter. A way to monitor the transmit agc level. And of course, the installation of new caps.

My question is this? are there two camps out there regarding any mods at all? Like an all original 67 corvertte?? All original R4a? or is the thought that if I can improve it, I should.

Now my twins are not pristine. They have moved around the country with me for many years. They have been stored in less than ideal conditions. They work as new or close tho, and have nothing other than new caps added--no cutting or other drilling, etc.

I've considered getting a couple of fixer-uppers to modify and be my "daily drivers" but not sure if I just might go ahead and mess with these. I don't think there is any financial advantage one way or the other--not sure we'll ever see the multi-thousand dollar level that the Collins S-line stuff has gotten to--even considering we have equal or even better performance. (S-line is certainly built better as it wasn't marketed to the same price point)

Anyway, I'd love to hear your thoughts on this.

Curt

Mine went deaf like that a couple of times and it was eithr:

1. the IF amp tube dirty contact--clean pins and reseat. It can be done from the back without removing cover. (V4)

2. the rf amp tube has gone south--try a replacement.

Thanks, Garey

Yeah, this bushing is red and crusty; I'll see what I can dig up.

On a similar topic, I know that there is a strong caveat to not have any lubricant on the nylon gears, but I'm guessing that the brass-to-brass pieces need a tiny dab of something after cleaning & polishing - is this true? I figure that Teflon bike lube should work quite well.

Yes. NO petroleum based lube on the nylon gears. I use just a tiny
drop of light machine oil on the lead screw / follower, and a dab of
Lubriplate on the ball bearings. The teflon lube should work fine.
Just don't overdo whatever you use. It's not a high speed machine, so
doesn't need much lubrication.!

Wink,
Don't sweat it, does it hear ok otherwise, mine r4 compared to a yaesu 857 does the same thing, but the meter shows an
s9 signal the same as the yaesu with the pre amp off. It definitely doesn't show the same noise floor as the 857 with the pre amp on, kind of nice actually, not so much unnecessary hash and static. I also checked and the r4 hears everything
the 857 hears.

Hi Al,

I just replaced mind a couple days ago, after figuring out what to use, I remembered I had seen something like it somewhere, and guess what? I used them in my VCR repair work, most VCR's Pincher roller will work, you will have to get a small screwdriver and pry it off its thread wheel, then cut it to the length you want. it's black just the right size for the shaft, I don't think this replacement will ever fail, hi hi.

I still have over 10 VCR machine that with their Pincher rollers so I will save them.

v44kai.....Joel.

Wink,

With the calibrator turned on and its signal peaked with the Preselector and tuning knob, what is the S meter indicating? If it's S9 or better, don't touch a thing, the receiver's working as it should. Peform this test on all bands.

Most Drake receivers, if they have not been abused by someone who didn't know what they were doing, do not need much in the way of adjustments, if any at all. Adjusting the transformers in a Drake receiver is not a simple tweak for peak receive signal. Fiddling with the transformers, not knowing which one does what, can really mess up the R4A.

What type of antenna cable are you using between the R4A and the transmitter? This cable should be 50 ohms, such as RG-174 (50 ohms) or RG-8x (50 ohms) or some other short length of 50 ohm coax. You can even use Radio Shack RG-58 (50 ohms) because the length of cable needed between the R4A and the transmitter is very short and any loss in the Radio Shack RG-58 cable is insignificant at this short length.

1259. TR-7 PTO Shaft - fixed!

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-05 20:58:40 UTC
From: Al Scanandoah
Topic: 1249 Message: 1259

I found a solution at Home Depot - picked up a pack of 3/8" ID grommets.
Two of them stacked are just a bit thicker than the original part, so
I dug through the junque drawers and found a thinner back-up washer to
use in place of the original.

The PTO is now reassembled and is as smooth as the day it came out of
the factory.

From: g4jss@tiscali.co.uk
Topic: 1244 Message: 1261

Hi

I had a similar thing with my R4. Basically I was getting a good calibration sig but poor sigs. Eventually the fault was found to be with the PTO. This supposed to have an a +11v supply which is obtained from a tap from the 150v line via a couple of resistors. I checked the PTO voltage and found it to be around 5v. The culprit was C149 on the PTO board which had gone leaky. Changed that and voltage OK and so was sig level.

Just a thought!!

1262. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-06 10:41:46 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 1262

All group memebers are welcome to post here on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others (what you put into this group you will get back so participate if you have a chance). Although we would like to focus on Drake Radio subject matter any Ham Radio subject matter is allowed. This includes any QST's of events or hamfests, especially if Drake radios are included

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our groups home page, as well as links to Drake information or your homepage.
Thanks to all members for your particapation.

Vic -

That must have been an R-4A or later. The PTO in the R-4 is tube based! The solid-state (bipolar) PTO came in with the R-4A, switching to FET in the second version of the R-4B.

So for the R-4, low PTO level would most likely be a weak V11. The screen dropping resistor and/or screen bypass have caused problems here. Another possibility would be V8, the PreMixer and Band Oscillator tube. MOST problems of this type are related to tubes, but after 40 years the resistors must also be suspected. The Voltage and Resistance charts are the best place to start troubleshooting this sort of problem, once _known good_ tubes are substituted in the signal and LO paths.

A simple good quality audio patch cable is fine for the leads between the receiver and transmitter, with the exception of the INJ cable, which must be a low capacitance cable such as Belden 8421 mic cable or RG-62 for best operation. A patch cable will work for the INJ if the receiver and transmitter INJ trimmers are adjusted with the pair cabled together, but the reduced LO level will cause lower transmitter output and/or low receiver sensitivity when using ONE unit to control the pair. This includes the REC ANT lead to the receiver, as it is so short as to be insignificant.

The only way to KNOW what the REAL sensitivity of a receiver is, is to use a calibrated signal generator. The advent of the Elecraft XG-1/2 or NORCAL S9 test generators make this available to anyone for as little as $30. The internal calibrator signal is a rough test, but its output is far from flat over the frequency range, and can vary 10 dB or more from one 25 kHz marker to the next. Generally speaking, the cal signal should be S-9 +10 or better on the low bands, and S-9 up to 10M, IF the best marker is selected on a given band.

The R-4 series of receivers are very quiet compared to many modern synthesized transceivers, when they are properly maintained and aligned. The design is inherently low noise for several reasons, not the least of which is the low B+ used which limits thermal noise in the tubes themselves. A clean, quiet AF section helps as well, at least up through the R-4B. A good check is to disconnect the antenna, and check each band by peaking the Preselector. You should hear a slight increase in the background noise as the peak is reached. It will be very slight on 10M, and unless the receiver is "perfect" in alignment and tube quality may be inaudible.

Yep Garey

I was basing it on a past problem with my R-4C which, as you pointed out, doesn't have a tube PTO. I should have read the original posting a little closer and not rushed to print. Another damned senility moment!!

1265. Transmitter Mate for Drake 2-B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-06 15:35:09 UTC
From: Randy
Topic: 1265 Message: 1265

Here's one of those questions to which there is no right answer, just opinions, but I'll ask it anyway. I have a Drake 2-B with the 2-BQ Q-multiplier (Picture on my QRZ listing). I have used this rig for SWL for many years, but I'm not thinking of mating a transmitter to it for HF work. Thus the question. What, in your opinion would be the best match to this receiver? Your answer can be either Drake or non-Drake equipment. I intend to work both CW and Phone, but I suppose I could have a transmitter for each mode. Thanks in advance for your thoughtful opinions.

Hi Randy,
My choice has been the Johnson Navigator (CW only of course). A nice size fit.

Randy -

My choice over 40 years ago was a Heath HX-20. Nice little CW / SSB transmitter almost identical in shape and size. Stable, filter, single 6146. I thought then and still think this is what Drake would have offered if they had made a matching transmitter! Too bad they didn't. :-)

Well, when I bought my 2B new around 1965 or so, I used it with a
Gonset GSB-100, which for its time had a nice stable VFO and was a
very competent CW and SSB transmitter. Rather beefy and hard to find
today with the original power transformer, but still a good choice.

Dang Floyd,

I sold the last of three Gonset GSB-100's last year. Two of them had the power transformer replaced with Peter Dahl and the one had an original. They were great "little" transmitters and quite stable for their day. I had nearly forgotten all about them.

Mike - I get the following with the calibrator on and peaked...
80m S9 +5
40M S9 +5
20M S7
15 / 10 M S1

What do you think now??
Tnx Wink

Randy, Not only do I agree with Garey, but have that setup myself, with the Drake 2B and Heathkit HX-20. The HX-20 with it single 6146 may be small in size with only 40 or so watts or output but has some of the best SSB audio that can be found. I also used this setup for awhile with a Johnson T/R switch which allowed me to run full QSK with the setup, and is really cool. I don't run this station as much as I should but it is a lot of fun.

I may be a little bias as this was the station my dad was running in 1963 when I was born.

Good luck but like you said there is no right or wrong and there are so many fantastic choices, that no matter what you come up with something will catch your eye at the next hamfest.

Wink,

It looks like 20, 15, and 10 appear to be down a bit, more 15 and 10 then 20.

Follow the R4's alignment procedures outlined in the manual. You may not need to perform a full alignment, possibly just a touch up on the RF amplifier on 20, 15, and 10 meters, see the manual for these adjustments.

Wink -

Definitely down on the higher bands. Assuming you have subbed tubes, (because tubes lose gain from the "top down",) a touch-up of the trimmers may help.

Have you done the S_meter calibration yet? Verify that all four slugs on the rear of the Passband Tuner are moving in and out together as you rotate the knob.

I would check the Preselector to be sure it rests at "0" when full CCW, and carefully check the height of the slugs for each band per the manual. Be VERY careful here, as it's unlikely they have been adjusted, and there were different heights for different slugs (color coded). I'm not sure if you are working on an R-4 or R-4A. The R-4 requires an additional crystal at 13.6 MHz for alignment, the four slugs are individually adjusted and at varying heights. In the R-4A all four slugs should be at the same height. Then go through the trimmer adjustment procedure in the manual, carefully measuring the slug height for each band as you go.

I would strongly advise NOT attempting to adjust the "Crystal Filter and Filter Match Transformer Alignment" step regarding the wires twisted around the pins of the transformer. This is a touchy adjustment, especially the first few times you do it, and is almost certainly ok, absent obvious tampering.

If still no luck, you're probably down to Voltage and Resistance checks, as you probably have one or more resistors that are out of tolerance.

Thanks Garey and Mike -- I will try tubes next. Think 12BZ6
6HS6 - 6AU6 first then go to the second mixer.
Garey, yes, it is an R-4 and passband slugs seem to be
working ok and S mtr has been calibrated. I do notice the .4
filter pretty much silences the rcvr though.
I will try re-peaking the trimmers also.
Thanks for the tips guys ...
will let you know soon as I get some tubes to try.

1278. 6JB6A Substitute

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-07 16:50:30 UTC
From: john baker
Topic: 1278 Message: 1278

Hi guys,
Just picked up off e-bay a pair of finals that were supposed to be 6JB6As. When they came in they ended up being 6KM6s. They seem very close except that they either handle or require quite a bit more voltage; I am not sure which. Are these a great, "bullit proof" substitute or will they be starved for power and not perform adequately? Before I sent them back I wanted to the word from you guys in the know.

Thanks much

JB -

Well, at least the have the same base connections! :-)

I've not had any personal experience with the KM6s, but their interelectrode capacitances are about 50% higher than the JB6, and so you "may" have a problem getting them neutralized in a stock transmitter. The input capacitance is MUCH higher (1.2 pF vs 0.2 pF) but that probably won't be a problem, except perhaps on 10M. They DO have a slightly higher plate dissipation, but that won't do you much good if you can't neutralize them.

The 6GJ5 is a much better sub if you just can't find JB6s. Perhaps someone here has had direct experience?

I made the same mistake a number of years ago, buying a few KM6s. The seller said they were exact replacements and would work fine in my T4XB, back when I had a T4XB. Neutralizing them on 10 meters was a royal pain, never did get it right. Stability on the higher bands was way out of whack.

I was in Germany at the time, working for GD as a contractor so returning them was not an option, shipping cost was too expensive.

If the ad clearly stated 6JB6s but you received 6KM6s instead, he should take them back and give you the right tubes or refund your money back, including shipping. Whether he will or not, I can't say.

I think we all know who it is. He's been doing this for over a year. I know of three other folks that have tried it, and it will not work. Neutralization is nearly impossible. And NO, I'm not one of them. I will pay a little more and use only Sylvania tubes in any of my Drake equipment.

Remember the old saying, "Buyer Beware"

And that's all I will say for now.

Ha! Yeah, thanks Mike. Rub it in...

These are GEs. Look new. Have people had problems with them? I would have thought they were a quality tube.

I'm sure they ARE a "quality" tube. Just that they were designed to be used at 15.575 kHz, NOT 28 MHz.

The Sylvania 6JB6 was ALSO designed for 15.575 kHz use, BUT Sylvania took the trouble to test and characterize several of their sweep tubes for use as Linear RF amplifiers. Probably why Drake used Sylvania 6JB6s in the original design. Sylvania also made all Zenith branded tubes, so they work just as well. RCA and GE brands also work within the adjustment range of the neutralization cap in the Drake gear. Any other branded 6JB6s may or may not work (neutralize) depending upon who actually made the tubes. Stick with 6JB6 or 6GJ5 of these four brands and you will be ok. Anything else may or may not work, at least not without modification of the transmitter neutralization network.

Sorry John,

I didn't mean to get up upset, but I can only tell you what I have learned over the many years I've been in this industry. I may have some KM6's out in the shop, and just might try to see what mods can be made in the neutralization circuits to make them work, if I can find the time.

It will get better, I promise.

Jim -

OK. I don't know if Lindahl actually made tubes themselves or not.
The only problem is that companies that did NOT make their own tubes
would often purchase from whoever gave them the best price, or happened
to be making the tube they needed at the time. So you could purchase
another set of tubes marked Lindahl, and they wouldn't work! IF they
had an exclusive agreement with GE, then your chances would be pretty
good that they would.

Obviously, ALL tubes were not being made ALL the time, even the big boys
would do a run of 12AX7s, then reset the line and make 12BY7s, so if
your regular supplier was out of 12AX7s and wasn't going to come around
to them for a month, you might go somewhere else.

Also, certain types were made by only one or two manufacturers, but sold
by a dozen! There was some exchange even among the majors when demand
required it.

Zenith had an exclusive agreement with Sylvania, but I understand that
was unusual. Zenith's touchstone was quality, and staying with a known,
consistent manufacturer would have fit in with that goal.

John -

It all depends upon who made them. The tube was DESIGNED to operate at 15.575 kHz. For one to operate in a particular circuit with specific neutralization values really is a matter of luck, since differences in manufacturing that make no difference at 15 kHz can be critical at 28 MHz. The 500% increase in the Plate capacity of the 6KM6 over the 6JB6 _in the RCA Tube Manual_ makes absolutely no difference at 15 kHz, but is significant at 28 MHz.

I guess the question is, does your transmitter neutralize properly on 28 MHz? Maximum RF output at minimum Final plate current? Do you get over 100W output on 10M?

Yes, but do you operate the radio on 10 meters? Lots of the substitute tubes work on the low bands but don't work good on 10 ,15 and sometimes 20 meters.

All the TR-3s I have seen require you to switch from Receive (SSB) to
Transmit CW by hand. Major rebuild of the T/R circuits would be
needed to make it semi QSK.

What you are looking for is called the Drake TR-4CWrit.

Larry,

Thanks for the response. I don't think I can let this one go however because it is in such good shape and the price is right. So I might just pick it up and see what I can figure out for myself from the schematic. Any idea about IF Shift?

Thanks,
Chuck

All the TR-3s I have seen require you to switch from Receive (SSB) to
Transmit CW by hand. Major rebuild of the T/R circuits would be
needed to make it semi QSK.

What you are looking for is called the Drake TR-4CWrit.

Chuck -

I see Larry has answered your question on the TR-3, and that your membership has been approved.! Welcome.

The TR-3 does require manual switching from transmit to receive for CW. It was designed as a mobile SSB transceiver, and CW was definitely an afterthought. The TR-4s are better, but all, with the exception of the 'rare' TR-4CwRIT are not a lot better suited to CW. While the TR-4's and the TR-4CW are "semi-breakin", without RIT they are still not very pleasant to use on CW. Believe me, you will be a LOT more satisfied with any of the Twins for CW. ALL have excellent semi-breakin, and maybe I'm just old, but I'll take a separate receiver and transmitter over a transceiver any day. I have several 7 lines and a Kenwood TS-940SAT. The TR-7 / R-7 pair work fine, but I never use transceive for CW. I'm about 95% CW, and have been for 50+ years.

By the way, there is no simple way to implement either semi-breakin on the TR-3, or RIT on any of the TR3/4 series. Likewise there is no simple way to implement Passband tuning on any of them.

If you just want a good station for very pleasant CW operation on a day-to-day basis, find a nice late A or B Line and set them up. If you like contesting or other VERY crowded band situations, the C Line is better at slicing off a single signal when surrounded by 50 over 9 signals, as found during low band contest weekends.

John -

Well that's probably a good potential sub. RCA may have used a
different internal geometry than GE on this tube, or perhaps the GE
branded tubes were built by yet another manufacturer. With the higher
plate dissipation of the KMs, I'd expect the capacities to be larger,
but not 5 times the JB in the RCA manual. I'm a little surprised the
neutralization cap was able to cope with the difference. It only has a
5.7 pF delta C max.

Like I said earlier, Sylvania, Zenith, RCA and GE 6JB6s _always_ work,
at least in my experience. Any other brand or type _may_ (or may not.)!!

> John -It all depends upon who made them. The tube was DESIGNED to operate at 15.575 kHz. For one to operate in a particular circuit with specific neutralization values really is a matter of luck, since differences in manufacturing that make no difference at 15 kHz can be critical at 28 MHz. The 500% increase in the Plate capacity of the 6KM6 over the 6JB6 _in the RCA Tube Manual_ makes absolutely no difference at 15 kHz, but is significant at 28 MHz.I guess the question is, does your transmitter neutralize properly on 28 MHz? Maximum RF output at minimum Final plate current? Do you get over 100W output on 10M?73, Garey - K4OAHGlen Allen, VADrake 2-B, 4-B, C-Line & TR-4/C Service Supplement CDs<www.k4oah.com>John Page wrote:> I have been reading this thtead with interest as I have a T4XC that I have 6KM6's in and I have had NO problems with. Hello,
Tonight I was checking the bulbs for voltage for the vfo and meter
for proper voltage and my probe slipped. Seems I blew the filament
fuse, I know it is supposed to be a #26 tinned enamel wire but can't
find it.
Can anyone help me please,

Thanx,
Tim Ki6nQT

Always International Crystal for my commercial or "important" stuff. Other places that work well for CBs, scanners, earlier commercial or ham stuff are Cal Crystal & Jan Crystal.

The filament fuse is located on a small vertical circuit board just forward of the power connector. If you don't have the TR4 manual, download it from the following website:

ftp://bama.sbc.edu/downloads/drake/tr4/

Turn to page 33 of the manual and you will see in the picture of the TR4's chassis bottom where the fuse is located.

Chuck,

I agree with Garey. As Garey indicated, there is no simple modification to incorporate an IF shift circuit with any of the standard TR3/TR4 transceivers, excluding the TR4CW/RIT of course.

If power is one of the reasons for selecting the TR3 you would be better off with an external linear amplifier and separates (T4XB/R4B or T4XC/R4C) than a TR3. Any of the separates will work together, that's the beauty of the Drake separates. You don't have to have a matched set, i.e. T4XB and an R4B. For example, you can mate a T4XC with an R4B or a T4XB and an R4C.

Another thing you may not have thought of. The moment you drill a hole in the TR3's front panel for the IF Shift control is the moment that TR3's monetary value drops tremendously regardless whether the modification works or not.

Garey,

Well, this TR-3 has the additional RV3 VFO-Speaker and PS-4 power supply with it. So I am assuming that RIT should not be an issue because I can transmit with the VFO on the rig and receive with the RV3? and it should work just as good as a set of twins. As far as the manual switching, I guess I can handle that for a while. I do have an ICOM IC-745 as well but it is on the bench right now with PLL problems that I am trying to resolve. So if I get them both working then I guess I have the best of both worlds.

One question, WHERE is the T/R switch on the TR-3??? I don't see it on the face plate, how is manual switching accomplished?

Chuck

Mike,

Thanks for the advice. I just wrote to Garey that this TR-3 has the RV-3 VFO and PS-4 with it so RIT is not necessarily a problem. If I were to design an IF-Shift for it, I would put it in it's own can and wire it in so that it could be removed without mod to the chassis or cabinet... I realize the value of a pristine cabinet...!

I think either way I will enjoy the rig. I just love the old Drake stuff and I miss my 2C and 2NT terribly. I had a homebrew VFO for my 2NT and I tell ya, that 2C was one of the hottest little receivers I've ever owned. Now I'm sorry I ever sold it.

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-10 14:48:16 UTC
From: Joel
Topic: 1209 Message: 1307

Hi Garey,

I looked at the signals with my scope last night, and found U9027 (Qs) not doing what they should, to confirm that I put in (2) IC sockets for U9027, and U9020, them I switched both IC's, when I took 9027 out nothing change, I removed 9020 and left it out of circuit, insert 9027 in 9020 socket and got the same result as first(no digit) Blank.

So, I now need (1) MC-14510B.
I was also thinking, since the (e) bottom left led in the fore most left digit is bad, I will also need the MHz display assembly, unless I can MacGyver moving led (c) that will never be use to (e) I think that's impossible though.

So, I need (1)MC-14510B, and the MHz display assembly only (just the 2 first digits)

Garey, do you have anything around, or Anyone else with a parts unit that can help. It's a very long process to order from the v4 land, I will be willing to pay something reasonable for these if someone can source them.

Work will continue tonight on the rig, I'm trying to see if I can get it to receive on my local AM station 555 kHz, it sound very very weak, it's just a mile from me, any suggestions.

v44kai.....Joel.

Joel -

You're probably going to need a scope to find what is going on. It might help to read the "Display Section" of the Troubleshooting guide. D1 through D6 control "which" digit is illuminated, and "a, b, c, d, e, f, g" what the illuminated digit reads. The key is that the digits are coded and illuminated one at a time from the same set of latches.
I believe you said it was displaying an "8" but with the lower left segment (f) missing. The fact that the digit displayed is NOT a "valid" digit may also be a clue. The latch for the first digit is U9025B, and the "8" line is Pin 10 (Input) and Pin 11 (Output).

Without a multi-trace scope, the best you can probably do is check all of the (Q) lines on U9027 and U9025 to determine if any of them appear to be "stuck". All of them should show pulse activity as the counter runs, and if one or more is always "high", "low", or "open", then that may be the problem. These two chips and associated wiring are the only circuitry unique to that first digit, all the other chips are either associated with other digits or are common to all digits.

Chuck -

OK. That changes the situation a little, but really not all that much.
Granted the RV-3 solves the RIT problem, but you're still giving up the
Passband tuning and narrower IF filter options of the A or B receiver.
Also no Noise Blanker.

T-R switching is by the Function switch, meaning switch between SSB and
X-CW. Heavy wear on an "impossible" to replace switch.

As Mike said, you can "mix and match" among all the 4 Line separates,
although it's not that difficult to find a "pair".

Chuck,

As Garey said, the RV-3 does change things but only slightly.

However, the RV-3 doesn't change the fact that the transmitter and receiver share the common 9Mhz IF in the TR3 just as in the TR4 series. Any changes done to the TR3's 9Mhz IF to achieve IF shift can lead to reduced transmit and receive gain resulting in improper operation.

Good luck and I'm sure you're going to enjoy your TR3/RV3 combination just as it came from the factory.

Hello
is any one can let me know what cap need to be change in the rx ?
is it x2 100uf -250v ?
and x2 10uf-250 v ?
and what Else NeWS to change ?
it is not the tube making the hum i did change them ,
any help from any UK where to buy capacitor ?
i try RS but they sell 100uf at 400v i do not think it is good
thank you for any support
good weekend

1313. More on the 30M crystal question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-10 19:01:04 UTC
From: captcurt2000
Topic: 1313 Message: 1313

OK...I have a couple of sources for the HC6 crystals..

A couple stock the "standard" Drake receive frequencies..in this case, 21.1 for 30M (10.0-10.5mHz)

However, I would like to transceive from the r-4 and the manual says to use the transmit xtal chart. So the chart says 20.8mHz. Seems the source I picked doesn't stocks and has not heard of selling one at 20.8 for 30 M.

Anyone out there actually running a r-4a/T-4x on 30 meters? What freq xtal(s) do I need?

Thanks

Curt

Curt -

20.8 Mhz is the correct frequency. 21.1 is ok for receive ONLY.
Difference is due to 21.1 crystal produces in-band spurious products in
the 10.1 to 10.15 range and must not be used for transmitters.

Well I replaced 12BZ6 (V1),6HS6 (V2), 6KZ8 (V8)
AND 12BE6 (V3), And results are the same. Still dead on 15/10 mtrs
and down on 20mtrs. Any suggestions on resistors to check
or replace would be appreciated.

Wink -

OK. This indicates that the problem is with V1 or V8 and associated circuitry.

Have you tried Transceive operation with the transmitter using XMIT control. This can eliminate the Band Oscillator and PreMixer stages (V8) if the level is considerably higher.

Check the voltage at TP-3 with a VTVM. Should read at least -1.5 to -2 VDC or better on all bands.

Check the PTO Output Coupler (T12) adjustment per Section VII, Paragraph F.

Do the four trimmers for each of the higher bands actually tune to a peak when listening to the Calibrator?

The can electrolytic is a four section. There is one additional electrolytic cap, C78, (10 uF @ 25 VDC) that Tom includes as part of his "kit". Not an expensive cap, and well worth replacing while you have the receiver open.

The four PS caps are all located in the aluminum "can" capacitor. This
can type is what is supplied by Tom at Hayseed Hamfest. It is a drop-in
replacement. You can see what it looks like at
<http://www.hayseedhamfest.com/capkit.htm>

C78 is mounted under the chassis, and is connected between V9, Pin 2 and
chassis.

Garey-
Transceive operation seems the same on receive , very low on 15/10.
TP-3 voltages :
80m 3.2
40m 2.6
20m 2.9
15m 2.6
10m 2.3
Guess I'm stopped at T12 adjustment -- I don't have a VTVM with
RF probe. The trimmers seem to have some peak at higher bands but not
much.

Wink -

OK. The RF Probe is not a big deal, see an excellent explanation at

<http://www.io.com/~n5fc/rfprobe1.htm>

You don't need absolute accuracy, just an indication of RF that can be used to peak the slugs in T12. The fact that sensitivity doesn't improve in Transceive control makes this adjustment much less likely to be the problem.

A VTVM is not absolutely necessary, but an analog meter is easiest to use when attempting to peak an adjustment.

Are all four slugs on the Preselector rack at exactly the same "height", or are they different? Later R-4 receivers were designed such that the slugs were all the same height, while the R-4 slugs were designed to be individually adjusted. I'm wondering if someone might have "adjusted" them per a later alignment procedure..... Do the adjusters have a thread locking matter on them, or are they clean?

Have you performed the Bias Adjustment procedure, Section VII, Para L, by adjusting the S-Meter "0" and then adjusting R40 for a Calibrator reading of 20 dB over S9 at 3.8 MHz?

From: tnham63
Topic: 1320 Message: 1337

Garey,
The Preselector rack has thread lock on the top of the slugs, and
they are at little different heights.Not drastic.
S-meter was adjusted, can't get 20 db over though, but I calibrated it
and it is same as another receiver on receive.
I'm not sure of the location of C38 and R52. I have your C-Line CD and
the 2B CD. Would it be on the R-4C CD or do I need your
B- Line CD?
I have peaked all the trimmer caps....

Thanks again

Thanks Garey,
I had assumed that each of the brands made tubes that would mix and match - with or without identicle model numbers - with other brands' specs. Appearantly I assumed wrong.

Really appreciate all the input. Am learning sooo much here. I remember we were the last family in the neighborhood to get a color tv... cause my dad was always replacing the tubes and tuners in that old Zenith b&w set. My first HF rig was, is, a Kenwood TS-520 handed down from a good friend fo the family. Then, to go mobile in my jeep, I went for an Icom 706mkiig. The Kenwood has tube finals, a hybrid, but I wanted something that was a total boat anchor to learn more from and understand our history a bit better. I seem to have the full evolution in my shack now. =)

Never was one to do something just because that is what you are supposed to do. I always need to know why that was the appropriate thing to do. Get's me in trouble at work sometimes too. This was great insight. Learning more and more. Thanks so much.

God bless

Oh! Listen. No appology needed. I appreciate your comment. My comments were just laughing at it. It was only the seller's fault that I got the wrong items.

As I elaborated in response to Garey's post, I assumed all brands had models that cross-referred equally and just thought you were being biased towards a specific brand name only. Didn't understand that GE might not have a tube that had the same design specs as the 6jb6. I will be sending these back. They were not what I purchased and feel somewhat deceived at the moment.

Appreciate your honesty. Hate sugar coating; it is always misleading.

God bless

1340. New to the forum with an R4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-14 13:09:23 UTC
From: bosonob2000
Topic: 1340 Message: 1340

I recently acquired a excellent condition R-4B and it seems to work well on all bands, calibrates etc. I was curious about a few of things.

How does the dial read? Does it read the carrier freq for CW and SSB?

Is there a BFO offset or is it zero beat with the I.F?

The passband tuner is mostly symmetric with noise pitch, however on 0.4 the left horizontal knob position noise is slightly lower in pitch than the right horizontal position. Looking at the spectrum the passband moves out slightly farther at the right horizontal position. USB/LSB receive fine. BTW, how does that passband tuner work? usually you have to shift VFO and BFO to get passband tuning i.e. Collins 75A4

Also on 0.4 should the center of the passband give the highest CAL reading on S meter? It does for all the bandwidths also. It also gives the lowest audio without antenna/CaL.

The PTO is mostly linear. It feels very good with no wiggle. The person I got it from used the T4X PTO most of the time so it feels like 1968. Nope, no oil or grease:) I assume that there is no easy PTO linearity adjust. For instance at 1.00 end the CAL zerobeat is at +2Kc.

How warm should the PS get? I know its crankin Class A with the 6EH5 but the PS transformer gets a little hot. not extreme and you can touch it without burns.

I have some IERC tube shields. Should I use them? I admit to never seeing any Drake gear with shields other than the 1st RF etc.

I have read the manual/alignment that came with it but was curious.

That's a bunch of good questions! I'll try....

bosonob2000 wrote:
> How does the dial read? Does it read the carrier freq for CW and SSB?
>

The dial reads the suppressed carrier frequency on SSB. It reads the Carrier frequency on CW when the signal is tuned to zero beat.

> Is there a BFO offset or is it zero beat with the I.F?
>

The BFO is at zero beat with the IF center frequency when the Passband Tuner is set to the center of the bandwidth lines
.

The pitch of the noise should be the same at the dots at the end of each line on the Passband Tuner knob for each bandwidth.

The reason for the difference with the 75A-4 is simple. In the 75A-4, there is a single, fixed mechanical filter centered on the IF frequency. The Sideband is chosen by moving the BFO to one side or the other of this fixed bandwidth. Since the BFO is moving, the PTO frequency must also be moved to keep the receiver tuned to the "same" frequency.

The Passband Tuner in the Drake receivers is a filter than can be moved in frequency while maintaining a constant bandwidth. So in this case, the Sideband is chosen by moving the passband itself to either side of a fixed BFO. Since the BFO doesn't change frequency, the PTO doesn't have to either!

The trade-off is that while the mechanical filter provides a very steep-sided passband, you must have a separate, expensive filter for each bandwidth. With the L-C Passband Tuner, the four filter sections are made tunable by a rack that moves the four inductor slugs to move the center frequency over a narrow band, while fixed capacitors are switched in to maintain resonance and adjust coupling between the

sections to keep the bandwidth constant as it is moved. The trade-off here is that the bandwidth is not as steep-sided as a mechanical or crystal filter.

Personally, for day-to-day operation, especially in the relatively uncrowded bands today I actually prefer the gentler slopes that allow you to hear what is going on around your frequency, just at a reduced level. If you are into contesting, where you have 10 signals that are all 50 over S9 jammed into a 2 kHz section of the band, you may prefer a mechanical or crystal filter as in the R--4C.

> Also on 0.4 should the center of the passband give the highest CAL
> reading on S meter? It does for all the bandwidths also. It also gives
> the lowest audio without antenna/CaL.
>

When the Passband Tuner is set to the center of the line for a particular bandwidth, the filter is centered in the IF, and so the strongest signal will be at zero beat. It is also "hearing" the "center" of the IF, e.g., for the 400 Hz b/w you are listening to the band of audio from 200 Hz in the LSB, to 0 Hz, and up to 200 Hz of the USB.

> The PTO is mostly linear. It feels very good with no wiggle. The

>
The PTO is specified as accurate to within +/- 1 kHz when calibrated at the nearest 100 kHz point, and the total error end-to-end as 3 kHz. There are no linearity adjustments on the PTO.

> How warm should the PS get? I know its crankin Class A with the 6EH5
> but the PS transformer gets a little hot. not extreme and you can
> touch it without burns.
>

The power transformer does get quite warm in normal operation. The AF output IS Class A, but as with most tube amps, a leaky input coupling cap, or leaky cathode bypass cap can cause it to draw considerably more than it's normal 35 mA. The 6EH5 tube WILL burn you if you grab it too soon! That said, in over 50 years of using and working on Drake 4 Line receivers, I have never seen one with a bad power transformer that was NOT subjected to abuse. Abuse means a shorted filter capacitor or rectifier, usually in concert with an oversized fuse installed by someone too lazy or cheap to obtain the correct fuse! I have found foil-wrapped, blown fuses and in one case a length of #10 AWG copper wire in fuse holders. The FIRST thing I do with a "new" receiver, (or any other electronic equipment,) is check to see that the correct fuse is installed.

> I have some IERC tube shields. Should I use them? I admit to never
> seeing any Drake gear with shields other than the 1st RF etc.

>

The IERC shields are better than a bright metal shield, but not better than NO shield. The IERC shields can reduce the envelope temperature of a tube, but really don't make much difference unless there is sufficient air movement to get the heat away from the area. The best thing you can do to reduce the temperature of the receiver, and extend the life of all components is to add a small fan either on top (over the 6EH5) or at the back of the receiver blowing air _OUT_ and away from the area. It doesn't have to be a wind tunnel, just a gentle, silent fan to help the natural convection airflow. The only tube needing a shield is the RF Amplifier, and an IERC shield here will probably extend the life of the -BZ6.

Garey,

Do I need to check the audio caps and the powersupply cap? The supply voltages I checked were within a volt for all the tubes B+ as listed in the manual. I just want to make sure that the 6EH5 is not drawing too much current.

BTW, I notice early R4B's had a OA2(I think?) regulator for the B+. Why not regulate the voltage? Also why did they use the B+ for PTO voltages? Would it be better to get a modern TO regulator and feed the PTO off of that?

Stefan -

Without an ESR meter, (or equivalent,) correct DC voltages are about all you can do. They're probably fine, just be sure the fuse is correct!

You can measure the voltage across the cathode resistor of the 6EH5, (R44, Pin 1 to ground,) should be about 4.5V, indicating 37 mA assuming the resistor (120 ohms) hasn't changed value.

The 0A2 was removed in Version 2 of the R-4B, (and the PTO was converted from bipolar to FET,) since the tube stages it was originally intended for had been converted to solid state. The big series resistor to supply the Zener regulator in the PTO has been criticized for years, but the fact is that it is an almost ideal current source. The Zener is adequate regulation for the PTO and Band Oscillator as it is being driven from a current source that swamps any changes in the HV source.

A three-terminal regulator "might" be slightly superior in regulation, but of course they weren't available when the R-4B was designed!. At this point, I doubt if the difference would be measurable in frequency stability of the PTO. Again, pulling hot air away from the cabinet to reduce and stabilize the temperature is far more effective in stabilizing the receiver.

Hello Stefan,

I'm sure Garey will comment on the regulated B+.

I'm not aware of an OA2 regulator tube in the R4B. That doesn't mean there isn't one, it's just been some time since I owned an R4B. However, looking at the R4B schematic I don't see one.

The PTO's voltage obtained from the B+ in the R4B is the same method used to power the PTO in the R4C. The PTO voltage is obtained from the 150VDC supply through a 4K 5 watt resistor which I'm sure generates some heat.

I agree, the PTO would be better served with a low regulated voltage supply, eliminating the 4K 5 watt dropping resistor.

As for the capacitors, I suspect one of the main key points of information pertaining to a capacitor's condition is the capacitor's leakage current. Based on Sprague's TO-4 capacitor checker's leakage current manual data the two 100ufd 200VDC filter capacitors maximum acceptable leakage current is around 2.3ma and the 8ufd 150VDC filter capacitor's maximum acceptable leakage current is approximately .46ma. To determine a capacitor's maximum acceptable leakage current use the following formula (obtained from Sprague's TO-4 capacitor checker manual):

I (capacitor leakage current) = kc + 0.3

K ------ WVDC
.01 ---- 3 to 100
.02 ---- 101 to 250
.025 --- 251 to 350
.04 ---- 351 to 500

Based on the above K chart, all of the power supply filter capacitors in the R4B would have a K value of .02.

C = capacitance in ufd

You indicated the voltages appear to be within a volt. It appears based on your voltage checks the capacitors are OK, at least for now.

Well, the problem is that there is no low voltage supply in the "B" to
regulate from, so you can leave the heat in the resistor or leave it in
a regulator!

Thanks to everybody, what a great group! I have one more pertinent question regarding the audio impedance. I don't have a 4 ohm speaker, but I do have a 600 ohm speaker. I have been running the speaker through the 600 ohm headphone output. I get a room full of audio. Now, Is this OK? I looked at the schematic and really did not see any difference between the 4 ohm and 600 ohm output connections from the output side of the transformer. Usually it is a different tap on the output for 4 or 600 ohm but this one only shows one winding and parallel (or seemingly so) connections to A) the RCA on back and B) the headphone output.

Oh, Can you use the antivox output for HiZ cans like I use on my regen?

Again what a great group!!

Stefan -

There is only one output from the R-4 series receivers, and it is 4 ohms. For maximum audio, you need a 600 : 4 ohm transformer, (or a 4 ohm speaker,) regardless of which output you use. The more common 8 ohm speaker will also work quite well, with slightly lower output power capability. The ANTI-VOX output to Hi-Z phones will work, but you may find the signal to noise ratio poor, since you will have to run the AF GAIN control so low to compensate for the very high sensitivity of the phones.

As long as you get sufficient audio from your 600 ohm speaker, it shouldn't hurt anything. Having the output essentially "unloaded" doesn't seem to bother the AF output transformer, although that "can" result in high peak voltages across the input winding.

Garey,

Well, since I didn't have nothing to contribute concerning the B+ I figured you would... :)

You're right, the schematic I have must be one of those you mentioned. I downloaded it from the Belgium Drake website. I can't tell the serial number, it's too fuzzy or my eye sight's getting worse. Probably a combination of both I'd say.

I'm rewiring a Johnson Viking 1 speech amplifier. What a royal pain in the you know what. Some previous owner didn't know how to wire components and solder, that's for sure! It's not mine. It belongs to a ham friend in Muskogee, about 75 miles north from here. It works but the resistor wiring was horrible. Most of the capacitors were old (wax paper type). Replacing them with new Polyester metal film capacitors from Radio Daze and Mouser. Some of the resistors were parallel combination to achieve the value but, they increased in resistance quite a bit, more than 10%. Replacing them with metal film 5% resistors. Manual's part list has two different values for most resistors. For example, a resistor was listed as 220K OR 240K or 47K OR 51K, I used the common value.

Component sizes sure have changed over the years. For example, the .1ufd 600VDC molded paper and .02ufd 400VDC wax paper bypass caps are 10 times larger, or more, in diameter then the size of the new caps. Not the first time I've done this, replacing 50 year old components with new modern components. The 1 watt resistors today are the size of 1/2 watt old carbon resistors. Of course the Viking 1 was sold in the early to mid 50's, things were different back then. Well, enough of that, this is a Drake forum not a Johnson Viking 1 boat anchor website.... :)

John,

I will admit, one of my TR-4C's does have GE tubes in it. Seems to work just great. But like I said, I only replace any with Sylvania tubes. The GE's were in it when I bought it about a year ago. SRI for the rub, but that's just my personal opinion!

Wink -

I don't have a CD for the R-4, and the R-4B is considerably different in that area. The general area is between sections 3 and 4 of the bandswitch. The little capacitors that are sticking through holes in the shield between these two wafers are the fractional pF caps coupling the secondaries of T3 and T4. C46 is a 0.82 pF cap, so would have a gray and red color coding stripe. I'm suggesting that you inspect this cap to make sure that it hasn't been damaged physically and/or that the connections at either end are OK. These caps don't fail, in my experience, but someone poking around in the area can damage them. R52 is a 330 ohm, 1/2 W resistor and is connected between the +150V bus and the bottom of the T3 winding. Again, check for physical damage and correct resistance. This resistor is susceptible to damage if someone uses a metal alignment tool to adjust the trimmer caps and allows the tool to short the adjustment screw to the chassis, even momentarily. This is all too easy to do working through those little holes in the chassis. A short here puts the entire 150 VDC across that little resistor. Not good..... If you don't have a non-metallic alignment tool, put a piece of tape or heat-shrink tubing around the screwdriver blade just behind the tip.

R5, a 1.5k, 1/2W resistor is also susceptible to the same problem and should be checked as well. This resistor is connected between a terminal strip mounted on the shield behind the first bandswitch wafer and a terminal on T2

Another thought occurred to me. Have you tried subbing the Calibrator tube??? A weak tube "could" cause this drop-off in output on the higher bands. That would be embarrassing! :-) Calibrators have been solid state for so long .....

Garey,
Yes I have tried swapping the 12BA6 Calibrator tube with
a few others I have and no change. Let me check these other
components and see what I find.
Thanks for the help, will let you know.

They are indeed very different. Attached are the data sheets for each 12BA6 and 12BZ6.

Also, Here is a GREAT web link for tube data sheets where I got these.

http://frank.pocnet.net/sheets0.html

Chuck -

OK.. I'm aware the tubes are quite different, but we are looking at
drastic differences in calibrator output, (if indeed that is the
problem,) and I'm not sure there is enough difference to account.

Certainly worth trying though.!!

1357. R-4 PROBLEM (UPDATE)

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-16 21:07:28 UTC
From: tnham63
Topic: 1320 Message: 1357

Garey -
The C46 and all the fractional pF caps look "factory" but I touched
them up any way.
The R5 checked 1.57, so it's OK.
The R52 checked 520 ohms -- So I put a 330 ohm in to fix that
But -- No difference on 20/15/10..
Now what?
My schematic also shows V12 to be a 12BZ6 but -- the copper
chassis is FACTORY STAMPED 12BA6 and it has a 12BA6 in it !!
What do you think about that since R52 change did nothing?

Thanks
WINK

1358. Was: 6JB6A Substitute, NOW: Twin Matching

LOL! Ah Hah! Hipocrite! =) (kidding)

I understand now what you were saying. Didn't at the time. Not educated enough.

I need to back track myself. (sheepish grin) I just looked at the ad that I got those tubes from and they DID mention that they were the GE numbers. Just that all I noticed was the big print saying they were 6jb6a replacements. Thought I would check before I called the guy up and, sure enough,.... Had I noticed I would have asked on here before I bid on them. Must have been distracted or something (give me a minute and I can make up a good excuse). Guess I'll keep them for the day when the 6jb6's are no more.

Sure appreciate the education from you, Garey and all.

Got a new Question, though.

Would there be any matching problems between a R-4b and a T-4xc?
and...
What were the differences between the T-4xb and T-4xc?

1359. Query on a TR-7 Rcvr

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-16 23:07:55 UTC
From: jch39_99
Topic: 1359 Message: 1359

Greetings Drake Operators.

I have a new to me TR7. Seems to work great but have noticed that I can hear two identical signals about 1600 cycles apart (approximately equal to twice the sidetone frequency). The lower in frequency signal is much stronger than the higher signal.

Using the Elecraft XG1 which puts out a "S9" signal at 7.040 I get the following:

S9 + 10db signal at 7039.2 and
S1-2 signal at 7040.8.

This may explain why I occasionally have not gotten a response from a CQer when I returned their CQ I may have been 1600 Hz off frequency. Is this normal?

Hi Crit

It sounds like you're hearing undesired energy on the "other" side of the zero beat. This is typical for a receiver in need of alignment.

With the TR-7, it's important that you start with the 40 MHz oscillator and work your way through the procedure from there, as any frequency error trickles downhill, and can mess up your IF passband.

If you have just the stock SSB filter, you may still hear a faint signal, but nothing at the level you're reporting. If you haven't already done so, splurging for a 500 Hz filter makes for a world of difference.

Crit -

The first thing to check is the Passband settings, the row of pots along the top edge of the little power supply board in the front right corner of the transceiver.

See one procedure at

<http://www.zerobeat.net/drakelist/passband.html>

As noted on this page, be VERY careful to not bump the LAST control on the right of that row, or you WILL need to do a full realignment of the radio!!

Tnx to Garey and Al for their input.
I will pop the top on the rig and see what havoc I can do.
I guess, I was hoping I would get "oh yeah, these 1970-80 rigs all
have a spurious sideband down XX db and don't worry about it, that's
w/in specs."

Okay did this Passband settings ... minor adjustment only needed.
No change in the extra sideband signal as before when inputting the
XG1 7.040 signal.
Full alignment might be needed. A bit beyond my limited skill set.

OK. If you turn ON the Passband tuning, and set the pointer to the center of its' range, when you tune in the Calibrator or the XG-1, the S-Meter should peak at zero beat. With both Filter buttons "out" and then set the pointer to either the USB or LSB marks, the S-meter should peak roughly between 400 and 2200 Hz beat note on one side and near noise level near zero beat.

If this doesn't work this way, you may have a problem with the -5VDC supply or bad PIN diode(s) on the Filter board. If this is beyond your comfort level, Gary (W8PU), Jeff (WA8SAJ) or Larry (K2LT) are all competent and fair repair people.

Using the XG1 the S-meter peaks at 7.040

> With both Filter buttons "out" and

Filter buttons are out.
PBT button is in.

Turning the PBT to either LSB or USB mark (the first mark) does
nothing to the peak of the signal on the S meter ... still at 7.040.

If I turn the PBT full clockwise or counter clockwise the peak is then
is arnd 7.0365 or 7.0429. Nothing heard at 7.040

Did I do it correctly and is the TR-7 working correctly?

From: rrkbogie
Topic: 1371 Message: 1371

Has anyone on the list constructed a ladder filter circuit simulation model of the TR4 sideband filters? I have two TR4s, and both have one SSB filter so far out of spec that it is unusable. - No, I can't just swap rigs to switch sidebands - the same filter is defective on both! One of the rigs has the "soup can" filter enclosure, and one has blue Tyco filters. I understand these have 4 and 8 pole filters, respectively. I'm curious whether someone has already worked this out before I try to do it myself.

1375. Another R4B question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-20 13:08:10 UTC
From: bosonob2000
Topic: 1375 Message: 1375

I have been really getting to know the R4B now and really like it. It is interesting how the R4B is probably the last complete rx when after that you had to buy filters and accessories that were previously standard. Now it seems we've come full circle with DSP IF rigs having all the filters and NB etc.

I was curious as to if there was a trick to knowing what freq you are on CW when tuning to a station. I'm used to rigs that have a built in offset so that at pitch you are reading carrier freq. I know most people use the T4X to spot what freq they send on but when trying get on proper freq to answer a CQ, it seems a little challenging. Can you just offset the dial skirt to account for the pitch? What did they do back in the day?

Hi Stefan:

I still run a R-4a/T4x ..when you swith the tx to spot, you will hear
a warbling feedback--just like zero beating in SSB, you just adjust
till the beat stops. With a little practice, it is very fast and
within a couple of Hz.

Curt,
If you are scanning for contacts using the R4/T4. Assuming your R4 passband settings are correct [set at the dots] do you zero beat the guy or match his pitch to be on frequency. The only previous experience for me has been with radios that you match pitch to match freq. I apologize for the question but it occurred to me that you could get things messed up especially with a variable passband radio without a BFO offset tec..

I should mention I don't have a T4X yet..

maybe I am overthinking a bit too...

Not all CW operators operate at the same offset. The problem with zero beating the CW's offset spot signal is you are zero beating not only at your end but also at the distant end. Therefore the distant end may not even hear you if you zero beat your CW offset spot signal with the distant stations signal. A transmitter's spotting signal is the actual transmit signal except the driver and final amplifier stages are not energized. What ever tone or frequency you hear from your transmitter's CW spot signal is exactly what is being transmitted through the driver and final amplifier out on the air.

Most transceivers have a built CW offset that is created by switching in CW crystals in the carrier generators during transmit. For example, the Heathkit SB-400 and SB-401 SSB and CW transmitters plus the HW and SB 5 band transceivers had a specific CW carrier generator crystal that is used in CW for the CW offset on their CW transmit signals. In CW receiver, however, these transceivers switched to USB CW receive. This is accomplished by a relay that switches plate voltage on the carrier generators, USB carrier generator crystal for CW receive and CW offset carrier generator crystal for CW transmit. Other transceivers such as Yaesu FT-757 series and the FT-857D, for example, have a different method of CW offset in both transmit and receive. Transceivers that have "CW N" or "CW W" uses separate CW offset crystals or frequency generating systems for each CW mode. Drake, I believe, has an automatic CW offset. I use the T4XC and R4C and what works for me is the same pitch method when responding to a CQ or adjusting the receiver to a comfortable transmit spot signal tone when calling CQ. Works every time for me.

Yes..I do it like Mike does for CW. The warbling was for spotting SSB.

As long as the T4 USB LSB is set for LSB (CW Position) in spot I match
the staions CW tone. That will put the T4 on the same frequency.
Like Mike, I've been doing it that way since I got the radios new in 66.

Monitoring with the rcvr unmuted and the rf gain down will confirm
that the T4 is on the same frequency as the distant station.

Hi

Just shows how procedures differ. I tune my 4C to an incoming signal and then adjust the tuning slightly to his zero beat. I then spot the T4 to zero beat on his zero beat and then move the Rx tuning back to where I can hear him.

Sounds a bit awkward but it only takes a second and you are spot on.

Being an avid QRQ CW operator for the past 30 years, I personally have always found that matching the tone works best because as the two tones get close to eachother (received signal and zero-beat oscillator) the tones create an intereference tone which is the combined waveform and as that approaches "zero hz." you can hear it in your ear pulsating slower and slower and when it's gone, you're right at zero-beat (this is why they call it "zero-beat", because there is zero, beat, from the interference waveform.....

My two cents worth.....

Its how piano tuners do there work..they count beats between strings.

You're absolutely correct about the term zero-BEAT. thats why its called that.

1385. Calibrator signal on TR-4

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-23 02:19:45 UTC
From: Tim Stotenburg
Topic: 1385 Message: 1385

Good day all,
I have a few questions which I hope you can help clarify for me.
While attempting the adjustment on the mixer and rf coils it says to
tune in the calibrator signal @ 3.8 Mhz, mine is at 3.70 Mhz. Seems
to be a bit off, I haven't run into this problem yet.
Will doing an alignment of the Crystal Calibrator more than likely
take care of this problem? Is This so out of wack that I should be
checking elsewhere first?
I would appreciate your time in possibly explaining of this circuit
to me.
Thank you,
Tim Ki6nqt

That's just it John I don't hear it on 3.8 but on 3.7....
I haven't dealt with calibrator circuit yet. Would going on with
the alignment as previously posted hurt or should I do something about
the signal being off freq?
Thanx and 73
Tim

You are actually hearing the signal on 3.8. Hold the dial skirt when you have the signal calibrator tuned in, and turn the dial until the number matches 3.8. Real simple, and the instructions for doing so are in the manual.

Hope this answers all the questions I've seen posted on this subject. Quite simple...

The calibrator oscillator is a 100kHz unit designed for high harmonic content. You should hear it at every 100kHz interval throughout the HF range. There is a calibration adjustment for this oscillator in the form of a variable ceramic capacitor on top of the chassis. If the oscillator frequency is way off, the interval between harmonics will be greater or lesser than 100kHz as well. You can check it by looping one end of a wire around the cal oscillator tube and placing the other end near a low frequency broadcast radio to measure the frequency of the harmonics from 500kHz to 1MHz, Then zero in more closely by zero beating the cal oscillator harmonic against WWV at 10 or 15 MHz.

Whoa. I would first verify the VFO frquency before I would go moving the dial. At 3.8 MHz the vfo output should be 5.2 Mhz. Verify this before moving ANYTHING. Else you will through off every band.

Hi

Apart from 3.8 how does the calib match up on the other bands? If they are all out by the same degree then probably a dial shift may be your answer. If it is only out on 3.8 then we have a different ball game.

Hi

Well as I said we all have our own ways of doing it. I have tried matching tone (pitch) but being a lousy singer I wouldn't detect the difference to within a mile!!

The bane of my life is the TR7 and its offset. I can never get it right. I am always under or over and rely heavily on RIT.

I once had a 902DM which had an adjustable offset which ranged between 400 - 800 c/s (h/z) and I found that 400 was about dead right.

Cheers

Vic

Good day,
Thank you all for your input.
The cal is off about the same for all bands. I will check vfo output and will check for dial accuracy(should have done this first) with my other radio after work tonight and will report what I have found.
Thanx again,
Tim Ki6NQT

1394. Re: Calibrator signal on TR-4

Well sorry all, seems the dial "is" off by 40 khz. Checked it with my Swan. And yes my Swan is on que :)
This is my second TR-4 but this one has the noise blanker which didn't work till after replacing the filter caps and man what a difference the blanker makes!!!
So thanks to each and every one of you for answering my call for help. You have a great site here and maybe I can save some doe on my heating bill with these great rigs.
Cheers,
Tim Ki6NQT

Glad you found the problem with the dial. I also had to replace the caps in the noise blanker on my TR-4C. keep 'em flyin'John Page K4KWMHollow State since 1953(ex W8PKU,N8BLB,NA8O)

To: DrakeRadio@yahoogroups.comFrom: stotenburg@...: Fri, 24 Oct 2008 02:01:09 +0000Subject: [DrakeRadio] Re: Calibrator signal on TR-4

Well sorry all, seems the dial "is" off by 40 khz. Checked it withmy Swan. And yes my Swan is on que :)This is my second TR-4 but this one has the noise blanker whichdidn't work till after replacing the filter caps and man what adifference the blanker makes!!!So thanks to each and every one of you for answering my call forhelp. You have a great site here and maybe I can save some doe on myheating bill with these great rigs.Cheers,Tim Ki6NQTSacramento, CA

Hello again
Had this problem before and thought I had fixed it but that does not seem to be the case.
To clarify matters I am talking about CW transmissions.
In the tune position I get full power with the gain about ten minutes to.
Move to X-CW and the transmitter won't key until I have moved the gain control to max and then I get full power but nothing less. Reduce the gain and it won't key.
The VOX cct. seems to be working OK as I can hear the relay latch in but it won't key until I increase the gain to max.
I do appreciate the in the X-CW position the gain has to be advanced beyond that used in the tune position but surely not as far as max.
I don't think it's a tube problem as I get full power on Tune it just won't key until I run on max gain.

Vic -

First guess would be an open GAIN control pot. This is a two section pot, one section controlling mic gain, which is the "active" control in SSB or TUNE modes. The other section is the CW control and applies a DC current to the diodes in the Balanced Modulator. From your description, it sounds as though this section has an open element, causing it to apply NO current until it reaches the end stop and then applying full current or max CW. This is the most likely possibility if the CW goes from zero to max at max gain.

The VOX is operated by the TUNE AF oscillator which also generates the sidetone. You should get the sidetone when you close the key, just no RF output.

Have you adjusted the "VOX" gain on the rear of the T4XC? If the VOX gain is not set properly, keying CW break-in will not work properly.

1402. Query on the TR-7 and the Filters

Yahoo group: DrakeRadio (2006 — 2011)

From: jch39_99
Topic: 1402 Message: 1402

Have 3 filters in my TR-7.
Stock SSB plus a 1.8 and 250 filters.

Thus A and B out = Stock SSB filter.
A in = 1.8
A out and B in = 250
A and B in = no audio (as it should be)

Here is the question ...
Can I move the 250 filter over thus
A in = 1.8
A and B in = 250

Less button pushing.

The filter slots aren't at all "bandwidth exclusive"; you can put a
filter wherever it works best for you.

Another receiver or transceiver's calibrator can be used to determine whether the TR4's calibrator is off frequency or the TR4's dial is off frequency. A simple connection between the TR4's antenna and the other gear's antenna, DO NOT KEY THE TR4 OR THE OTHER RIG!! Turn the other rigs calibrator on and tune the TR4's dial to a 100Khz interval. Do you hear the calibrator signal from the other rig? If so then the TR4's calibrator is off frequency. If not, the TR4's dial is off frequency. Using this simple method does not require placing the band switch on any specific band. The calibrators are designed to produce high harmonic contents allowing the calibrators to be used on any band.

If the TR4's calibrator appears to be off frequency, adjust the calibrator's variable capacitor to correct the off frequency calibrator signal.

It's highly unlikely that the calibrator is far enough off frequency to matter, unless the crystal has been changed. The trimmer cap will only pull the frequency a few kHz. Your test method works fine, BUT some transceivers manage to kick into transmit for a very brief time at turn on. So best to turn both units on and unplug both microphones before connecting them together!!

Good point Garey and I agree. That's why I stated not to key the TR4 etc when connecting them together. I assumed both piece of gear were already powered up and in receive.

I've found this method quite useful yet, again, I agree, the calibrator adjustment is limited in its adjustable range. I use my main R4C's calibrator quite often to align dials on other non-Drake gear. I recently used this method with my spare R4C because the spare R4C's calibrator is not working, bad crystal.

More than likely the TR4's dial is out of alignment, an easy fix.

Have a good day.

Garey/Mike
Re previously reported fault with Tx gain control only working at max on CW. This somehow seems to be heat related. I am a fairly early riser and my normal practice is to fire up the gear first thing and it may be a couple of hours before I actually use it - plenty of time for it to settle down and stabilize.But yesterday I tried it straight away and the gain worked normally but an hour later same problem with gain.
Another funny thing is that the gain control should be pulled out for VOX but when I do that the relay won't drop out (tried every VOX setting going). There is no RF out but permanent sidetone. But with the gain control in the VOX works perfectly.
Bit of a mares nest isn't it!!
Whilst I'm on the subject of Drake's, any ideas where I can get a 500hz filter for the TR7?

Cheers

Vic

Vic -

I'm on the road, and don't have much reference material. Have you checked C107? Bridging it with a good electrolytic might reveal a clue.

In CW, the MIC amp is converted to an audio oscillator, and the Sidetone is keyed by biasing CR15 on or off with keying. If CR15 is not being biased on when the key is up, the Sidetone would be continuous. Another path is via the B+ for the MIC AMP/SIDETONE V9a and MIC AMP V9b if C107 ESR is high, allowing the audio tone to be coupled AROUND the CR15 switch. In either case, this tone is what keys and holds the VOX closed in CW. Pushing in the GAIN control grounds the VOX circuit input, forcing the VOX OFF, even if the Sidetone is present.

Long-term problems are also sometimes the result of bad ground connections. Check mounting hardware for sockets and PC boards to ensure they are making good contact. Loosen sheet metal screws a quarter turn and then retighten securely.

Many thanks for taking the time to reply with advice - even though you are on the road.
Just checked with the cct. dia. and understand what you mean. I'll give that a go (C107 and CR15) when I locate them! Have got your 4 series CD so that should help. I suspect they will be on the same board - hopefully.

Seems my last post didn't post up so will try again:
Good day everyone,

Thanks for all the reply's. Seems that I am stuck on digital display mode and didn't realize that the analogue dial could be off, checked it with my swan and it was off(yes the Swanie is on que).

Hope I am not over analizing this new radio but I think there is something else wrong. While adjusting the filter matching transformers I had to really crank a lot of turns in to adjust according to the manual.

Now, I don't think this tr-4 is as sensitive as my other one.

A little history, I about this radio off of ebay(yea I know) for a good price because it has the blanker. At first the blanker didn't work and the radio had a hum so replace the filter caps in the radio and now the blanker works splendid!

I have been solid state and this tube technology is a real learning experiance but am learning(it is like relearning).

Can you give me some hints? How about some books that would benifit me on these fine radios as far as repair and theroy.
I can't wait till winter so I can start saving on my heating bills here :)
Thanx again for all the replys and such a great site,
Sincerely ,
Tim Stotenburg

Hello all
Been onto Inrad for a narrow CW filter for TR7 - which they can and will supply.
Now, an admission. I have never opened my TR7 and haven't a clue what's inside. So regarding the filter, is it a straight plug in job or do you have to remove boards, solder it in and remove or add jumpers etc.?
Regards

Vic - G4JSS

Greetings.
Yep ... remove the case (top). Remove the filter board. (Can make a
board puller using a clothes hanger)
Solder in the filter and replace board.

Vic -

The filters solder in, two pins per filter. They mount on a card that pulls out of the main chassis.

You just remove the top cover of the transceiver, pull out the card, install the filter, and replace. There are two coax cables that plug into the cards that are a little touchy to replace in that there is no male connector, just the stripped end of the coax. If you are not careful, it's possible for the coax center conductor to "miss" the receptacle and fold under rather than slide into place. Really much easier than it sounds, as long as you are careful. You might want to consider which of the three accessory locations to install the filter into because of the activation methods. The first of the accessory location is accessed by pressing the "A" filter button. The second location is accessed by "releasing" the "A" button and then pressing the "B" button. The third location is reached by pressing BOTH the "A" and "B" buttons together. If the only filter you have is the 500 Hz, and you install it in position "A", then it is selected by pressing the "A" button.

You can see a photo of the board at

From: jch39_99
Topic: 855 Message: 1418

Actually just put in a 300hz filter in my TR7. There are 3 pins and I
was able to get the filter board out and solder in the new filter w/o
having to unplug the coax cables.
Just my 2 cents worth.

1423. Drake six meter station

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-30 23:43:55 UTC
From: hummerham
Topic: 1423 Message: 1423

I have for sale an excellent Drake six meter station that has been completely restored. It works like new and looks great. The transceiver has the LSB, USB, and AM filters as well as the highly desireable Noise Blanker and original manual. This is hard to find equipment...especially the remote VFO. The station consists of:
TR-6 $750
RV-6 $750
I also have the AC-4 power supply, MS-4 speaker, W-4 swr/watt meter, and a new Shure 444 mic that I will sell with the station or separately After the TR-6/RV-6 sell. Some trades will be considered. Please email offers. Thanks & 73...Butch...K3AFR... k3afr@...

1424. 60 mtrs on the TR-7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-10-31 17:45:47 UTC
From: jch39_99
Topic: 1424 Message: 1424

This may be another of my the-answer-is-obvious questions ... but how can I be sure I don't exceed the 50w power limit on 60 mtrs? I turned the mic gain down some but my Ant Tuner meter still shows peaks that are well above the 50 watts ... and if I turn it down more, then seem to have little or not output most of the time ... or should I just not worry about it? Using the hand mic I got w/ the TR-7. Setting the power output is easy on CW.

Crit

The most reliable way to limit your TX power would be to adjust your ALC control (beneath the high-pass filter assy.) to 50 watts. Of course, that means that if you want to run > 50w on any other band, you'll have to reset the pot.

Hi all
just a couple of queries.
1) Does the R-4B have the same nylon drive gear assembly to the PTO as the 4C? In fact does it also have the same PTO?
2) Don't have a cct. for TR7 or a PS-7 so which are the VOX pins to use with a linear - my linear has a built in relay which is activated by the VOX (linear) pins on the TX.
Cheers

Vic

No, the B has a single dial disc, kHz are read from the marks on the main tuning knob skirt. Just as accurate, and essentially the same PTO. It DOES have a single nylon gear to drive the single disc. The only real difference in ALL the Drake PTOs in the 4 AND 7 lines is the one used in the TR-4CwRIT and the TR-7 / RV-7. All the earlier PTOs use the little terminal on the side just behind the gearbox for RTTY shift. In the /RIT and 7 line PTOs this terminal is used to connect to an internal varicap network for the RIT function. The TR-4 series PTOs cover 600 kHz while the others cover 500 kHz.

A fair copy of the OP manual for the TR-7 is available at

<http://www.wb4hfn.com/DRAKE/DrakeManuals/TR7/Manual_TR7.htm>

Hi Garey

Thanks again.

I think I understand what you mean. So the nylon drive cogs to a single perspex dial (4B) will be a different setup to the twin dial 4C.

So the drive cog units are not interchangeable.

If you can be bothered which pins are the VOX (linear) pins on the TR&

The C-Line PTO "might" be able to be grafted into a B Line. I've never tried it, but my concern would be the clearance between the chassis and the panel for TWO dial discs. The three mounting screws are the same, and all power connections are the same. The frequency range and output level is the same, so ... Let me know if you try it!!

The linear connections are provided on the PS-7 power supply. I think you are using a non-Drake supply, so the connections are at Pins 8 and 10 (GND) of the Power Supply control connector, which is the 10 pin Jones connector. The relay contacts are rated at 2A at 120 VAC, so should be able to handle most linears.

LOTS of possibilities.... Do you still have 13.6 VDC or so at the ACCY Jack on the back of the transceiver after the "thunk?" If yes, you may have a blown fuse (inside right front corner) - OR - a shorted PA transistor(s). If no, the Overvoltage Triac may be shorted or just misadjusted. There are four pins on the power connector, one suppies power ONLY to the PA brick, the other one supplies 13.6V to the rest of the radio. The other two are ground (chassis).

Save yourself a lot of headaches and get a Service Manual. There are lousy "free" copies on the internet with muddy photos and cut-up schematics, I found a CD version with good photos and full size schematics from a WB3 selling on EBay, but I'm away from home and don't have the call. It was I think $12 delivered. Or originals show up often on EBay for $30 - $50.

There is a nice description of the TR-7 cards and their functions along with general information at

Sorry, the AUX DC Phono jack is on the back of the PS-7 Power Supply,
not the transceiver. Careful not to short it when probing. There is a
small fuse inside the PS-7 to protect it.

I have very limited knowledge on the TR7 (most of what I know has come from Garey!) but might I suggest that you determine if it's your PSU or the rig.

Next to the fan housing is a 4 pin Cinch-Jones plug. If you connect 12v (a battery would do) to the two bottom pins the rig should come on. The bottom left hand pin (nearest the fan housing is Gnd. The bottom right hand pin is +ve.

At least you will know which is at fault.

1439. Re: R-4 Hum Problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-04 13:19:57 UTC
From: tjb813
Topic: 1436 Message: 1439

-
The first most obvious is the filter cap. Parallel a good value (same C more voltage) with each section and test to see if the hum reduces or disappears. If the hum goes away, you know what to fix. But, if the hum reduces but does not disappear, it more than likely is a filament to cathode leak. Slight hum can sometimes be produced by a small cathode to filament leak. Could be in most any tube as it get into the low voltage supply. Swap tubes one at a time with known good ones until it clears up.

Also check the cap in the cathode circuit of the audio output tube.

Just a few places to start.

Ron -

Sorry, the AUX DC Phono jack is on the back of the PS-7 Power Supply,
not the transceiver. Careful not to short it when probing. There is a
small fuse inside the PS-7 to protect it.

I have very limited knowledge on the TR7 (most of what I know has come from Garey!) but might I suggest that you determine if it's your PSU or the rig.

Next to the fan housing is a 4 pin Cinch-Jones plug. If you connect 12v (a battery would do) to the two bottom pins the rig should come on. The bottom left hand pin (nearest the fan housing is Gnd. The bottom right hand pin is +ve.

At least you will know which is at fault.

1442. Mic drive low on T4X

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-05 03:46:21 UTC
From: captcurt2000
Topic: 1442 Message: 1442

Good evening gentlemen:

Working on my old T4x. It has been recapped and has been working like a champ on PSK31.

I decided to try some SSB and it wont produce any (very little) output.

I cannot drive the mic gain high enough to get any reasonable plate current.

Now, the audio stage runs ok if I run it hard enough with the PSK input, and I can whistle into the mike pretty loud and drive it up to where it should be, but normal voice will not do it. It also does the same thing on CW, gain needs to be EXTREMELY hi to get a normal output PA current.

In tune, it looks fine.

I have compared inputs to the balanced mod with a scope to see the relative signal levels there between the PSK audio and the mike audio and it is a big difference.

I have tried alternate mics--same result. I have tried the mike (same one I've been using for 40 years (EV 664) on another input device and it seems to be working fine.

All resistances look as they should in the mic amp stages and the only voltage that looks out of line is the grid voltage on the first mic amp (12AX7) chart says -.9, I have -1.4.

Not sure why yet. the grid resistor measures 3.48M to ground. and the cathode is grounded.

Plate voltages are just slightly high on the first mic stage.

I replaced the .47MF coupling cap off the cathode of the 2nd mic stage.

Anyone have any suggestions on where to look next?

BTW, the 12AX7s have been swapped with new (more than one different tube)

One other puzzling item.

While going through a touch-up alignment according to the manual, the part where it adjusts the first osc to center on the USB and LSB filters and adjusting the IF amp and balanced modulator for max, cannot be performed as written up.

The first step calls for unbalancing the carrier bal and adjusting the osc to get some plate current. I cannot do that..It will not generate any noticeable drive that way--it will in TUNE, but not in any other mode. Seems this might be related.

I aligned the balanced mod and IF by killing the second xtal osc and monitoring the rf stream at the input of v-3 the mixer. You can see very low levels there and I have done the alignment that way previously. Again, the carrier can balance to nil and the rig runs with plenty of drive with significant enough audio drive from the soundcard.

So..I'm pretty much at wits end tonite. Any direction?

Thanks a bunch,

Curt
KU8L

1443. Re: Mic drive low on T4X

From: captcurt2000
Topic: 1442 Message: 1443

Here is some more quntitative information on the input levels:

With the gain control set to 10:00, which has been a nominally correct amount of gain in the past, it is taking 1.5V P-P from the sound card to drive the PA current to 150mA.

Of course, this is way out of whack for a mike input. The mike will put no more than about a third of that with a loud input.

> Curt
> KU8L
>

1444. Re: Mic drive low on T4X

Date: 2008-11-05 14:40:45 UTC
From: captcurt2000
Topic: 1442 Message: 1444

Another curious observation is that the VOX seems to work pretty much as it should. Even with the gain control at 10:00, the VOX will kick in at about mid-vox-gain setting with a normal voice input.

This really puzzles me now.

Does anyone have any signal-level reference measurements for these sections?

Tim,
The plates are connected to the terminals on top of the tubes. The supply voltage is connected to the bottom of the large vertical RF choke wound on the same form that holds up the plate cap connections. The screens are connected to pins 1 and 7 on the bottom of each tube. The pins are numbered 1 to 9 starting at the gap and moving clockwise when looking at the bottom of the socket - the sockets should be marked with the numbers.

Tim -

The feedthrough that looks like black plastic, second from the rear of the transceiver, is the Plate lead. The next one toward the front of the unit is the Screen lead. Be careful unsoldering the one that is a ceramic feedthrough (Screen) is easily damaged with too much heat or mechanical stress. It's also a bear to replace. Also, the insulation on the hookup wire is VERY susceptible to heat and will crawl back with just soldering heat. So it's best to unsolder the lead to the RF choke on the INSIDE of the shield rather than the hookup wire.

Be _S_U_R_E_ to discharge each of these leads to the chassis after disconnecting the power supply before touching them. If you're used to solid state, these things BITE!!

From: Jose V. Gavila
Topic: 1442 Message: 1456

Hello!

Well, I am back on the repair of a T-4XB and I have found it switches from RX to TX and then stays there for a variable period. Sometimes it is just less that a second but it gets worse progressively and finally is stuck in TX. Should I suspect of the 6EV7?. Any other thing to check?. I have set VOX control at minimum but it makes no difference.

Thanks!

Best regards,

JOSE

Jose -

Quite likely the 6EV7, caused by gas or grid emission. Gets
progressively worse as the tube heats up.

Assume you have verified bias supply voltage and VOX Delay control.
There are some large value resistors in the biasing for the 6EV7 that go
up in value.

Thanks a lot for your answer!

>Quite likely the 6EV7, caused by gas or grid emission. Gets
>progressively worse as the tube heats up.

Yes, it starts working fine but in some seconds gets worse and in minutes
fails completely to switch TX/RX

>Assume you have verified bias supply voltage and VOX Delay control.
>There are some large value resistors in the biasing for the 6EV7 that go
>up in value.

I have checked them and are close enough to nominal values so I guess I am
out of luck.

Of course, I have some thousand tubes in stock but NO 6EV7 :-(. Any sub
besides 6FQ7 (which I don't have either)?

Jose,
Have you replaced the electrolytic capacitors in the power supply and on the radio chassis? When switching from TX to RX, the load on the power supply changes and the resulting transient has to be absorbed by the power supply capacitors. If the power supply electrolytic capacitors are corroded or leaky, the result is a voltage ramp on the power supply lines, which gets coupled into many places in the radio and can interfere with the operation of the relay driver circuit. There are many options for replacing the electrolytics, but from personal experience I can recommend the the AC-4 power supply rebuild kit offered here:

http://www.sunlightenergysystems.com/theheathkitshop/

The electrolytic filter capacitors on the TX chassis should also be replaced.

This appears to be a heat related problem possibly in V10 (6EJ7).

Pulling V10 should cause the relay to de-energize.

A gassy V10 will cause this problem. A gassy V10 can cause pin 7 (grid
of V10B) to go positive which will cause V10B to conduct, energizing
the relay regardless of the VOX gain and anti-VOX control settings.

If you have a spare 6EJ7 then by all means replace it with a known
good 6EJ7.

Yes and no... yes on the PS (with an AC-4R kit, as you suggested) and no on
the chassis. I will need to check them.

>If you have a spare 6EJ7 then by all means replace it with a known
>good 6EJ7.

I have located a NOS 6FQ7, which is listed as an equivalent, and it works worse!. TX is enabled as soon as rig is powered and remains in TX...

So I have gone back to original tube and, well, now it is working better than before... it has just an small delay (about 300ms) to return to RX.

But then I have tried to load the rig on a dummy load. And it is only able to load to about 90W up to 40m. Going higher, as in 20m, it barely produces about 25W and with the PLATE control almost at maximum and having a very acute DIP. LOAD has little influence... soft finals perhaps?

Regards,

JOSE (who has spent far too many years working only on SS rigs and has forgotten how to deal with tubed gear :-( )

Hi Jose,

Yes, you're right, 6EV7. I appologize for that mistake. I honestly don't know where I got 6EJ7 from! The R4C has them so maybe my brain instantly switched to that, who knows.

I wouldn't write off the final tubes just yet. Although it's true, weak finals and/or driver tubes do have an affect on the final output, there may be other things that are causing low output.

You mention you installed the AC4 upgrade kit from Mike Bryce. I'm assuming you checked all the wiring and solder connections to be sure they are correct and good.

The low output can possibly be caused by the finals not being neutralized and/or an alignment issue.

Check the final amplifier's bias setting and adjust accordingly.

Just a few thoughts.

Jose -

A more common TV type is the 6CG7. Might be easier to find. I believe the 6BQ7 will also work, although it is a little undersized for the second triode. Would be enough to confirm the problem and/or get it going while you find the "right" tube.!

Jose -

You don't mention any problem with the Sidetone. If C129 ESR has gone up, tone can couple across the diode keying circuit, keeping the VOX energized after the key is opened. Bridging with a good cap can verify.

Weak finals will present as you describe, but RF and INJ alignment should be checked before replacing. Also, check R26 for value and condition. This is the resistor that goes crispy when a metal alignment tool is used on the trimmers and accidentally shorts to the chassis, even momentarily. Puts the +250VDC supply directly across that poor little 1/2 W resistor!

Hello all,

Thanks for your comments!. I think there are several problems in the rig, so will deal with them one by one... I will check T-4XB electrolytic (C129) and also the resistor (R26) Garey commented.

By the way, how much would you pay for a NOS boxed RCA 6EV7?

Best regards,

JOSE

The 6EV7 seems to go for around $5 here. The 6FQ7 has been glommed onto
by the audio crowd, so they are 3-4 times that. Another possible sub is
the 6GU7 that sometimes sells for a little less.

1472. Another try with the T4x

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-09 21:16:50 UTC
From: captcurt2000
Topic: 1472 Message: 1472

Have gone back to first steps in the t4x mystery. During the manual specified alignment procedure, I am stopped at the part where it unbalances the carrier balance control to get plate drive. It wont.

There is no sign whatever of plate current above idle no matter what I do with the carrier balance control and RF Gain.

In tune, it generates plenty of drive. In CW, the RF gain needs to be at 3:00 O-clock to get normal PA current and in SSB, it will not produce any drive unless I slam the mic input.

So..what would cause a lack of first oscillator drive with the carrier unbalanced.

I get plenty of oscillator output on the wiper of the balance pot. But very little out of the balanced modulator. Its like it never gets really unbalanced.

In CW, I get the variable DC unbalance voltage but it requires nearly .5Volts of DC there to get the CW output.

Ideas?

Thanks

Curt

1473. MSR-2 Problems

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-10 00:36:06 UTC
From: Mike
Topic: 1473 Message: 1473

Hello,

I have a Drake MSR-2 general coverage receiver that isn't working properly. The radio works fine on AM but receives no signals when switched to the SSB/CW mode. All of the filters appear to work properly in the AM mode (including the USB and LSB filters). However, when switched to SSB/CW, there is no audio and no detection of a signal (via the S-meter using a signal generator as source). Another peculiar thing. When switched to SSB/CW, the frequency display does not change when I turn the tuning knob, until I change back to the AM mode. It then shows the new frequency on the display. Anyone out there familar with this receiver and can point me in the right direction?

Thanks

To start, I would check to see whether the switching diodes are good,
and whether the balanced modulator transformer is tuned properly and has
good windings.

TDK Dipped radial lead ceramic capacitors on page 1783 of the current
catalog for your first three, if you will accept voltage ratings that
are a bit higher.

You should find the electrolytic in their catalog too.

Hi Bob:

I'm looking around the Balanced Modulator now. I havent looked at the diodes with the huntron yet but have another question.

I stated that the output from the carrier osc was good but Im not so sure now after reading a little more on various descriptions.

It seems that the p-p osc output needs to be large enough to turn on the diodes. and I'm not sure that it is.

What should the p-p osc output be on the wiper of the balance conrol? Approx.

I'm only getting .3v. I saw reference to several volts in several documents.

I'll be checking the diodes in the morning.

Thanks

Curt

Does anyone know the Cinch Jones P/N for the power connector or its Molex equivalent?

Also, by any odd chance, does anyone have a spare UV3 knob stashed away in a drawer or junque box?

1480. Drake FF-1 Pinout

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-10 17:40:12 UTC
From: DALE PARFITT
Topic: 1480 Message: 1480

I have been looking into building a Drake FF-1 and have some questions about the pinout shown in the schematic. Unlike the pinout numbers shown for the TR-4C and RV-4 (which shows all odd pins on one side of the connector and even pin numbers on the other side (2,4,6,8) the FF-1 schematic has these mixed and what I would think is the VFO out center coax (pin 6) is shown as grounded on the FF-1 diagram.
Any hints here or am I missing something obvious?

Tnx,

Dale W4OP

Hi Mike and Bob:

Well, I've looked at the bal mod diodes and transformer. They all look good. The fwd voltage across the carrier input diode set is .73V

I'm not sure it could be bad and still null out the carrier. It does do that just fine.

In the reading I have done, it seems that the carrier input wants to be several times greater than the audio input.

On the wiper of the balance pot, I get 1V P-P and .5VP-P referenced to ground on each side input to the balanced Modulator (after the 470 Ohm Resistors) This seems as though it is low but I don't have any solid reference info.

I am measuring this by turning off the other xtal oscillator so I just and at each output mode (SSB, Tune, CW, and AM) It is the same for each except for the slight frequency shift on CW and AM.

Not sure what you meant regarding the gain setting. Unless I'm missing something, the carrier oscillator is either on or off--no change in output level with drive gain changes or anything else.

I can go through the alignment of the balanced mod, and the two following tuned circuits by looking at the carrier signal at the input to the mixer. Its the only way to see the small signal. There is absolutely no plate current produced with the balance pot all the way off center so the printed procedure cannot be used. ((yes I try that with the xtal oscillator back on :)

All the resistance values in V1 look ok. I'm thinking that the grid-cathode voltage is telling a story tho--book says 1.6 on the grid and 4.2 on the cathode. I have 3.2 and 3.28 approx. The tube isnt running hard enough.

Could I have a soft crystal? Any way to tell?

Anything else I should look at?

Thankls again guys, I miss my rig!

Curt

Curt,
If the grid and cathode voltage on the V1 carrier oscillator are about the same, there's something wrong around there for sure. I'm sure you've already tested the tube. I'd follow that by checking the values of the fixed caps and the grid resistor, then carefully disassemble the C2 trimmer and run the parts through silver tarnish remover - then clean in alcohol and check for shorts across the dielectric and opens between the plates and their respective contacts.

1484. Passband tuner question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-11 18:57:04 UTC
From: bosonob2000
Topic: 1484 Message: 1484

Recently I put the audio out of my R4B through my computer to a spectrum analyzer to look at the passband. I noticed that the passband for LSB was not symmetric having a gentle slope toward the high freq. I compared this to the USB passband which is more symmetric and is noticeably higher in signal strength. The LSB is about 60% of the USB strength.

The center of each bandwidth line is the signal peak of a zerobeated CAL signal. The pitch of the dots is about right each side for each bandwidth. However the horizontally left side pitch is not the same as the horizontally right. I know the manual says it should be as part of the alignment. Tuning all the way One side of the passband moves it out much farther than the other. The pitch though for each dot range is about right. I also figure that the panel markings are approximate.I would figure the
tuner should have equal signal strength/shape for the LSB/USB passbands etc.

Before I attempt the manual alignment, is there any other tests or is there a better alihnment procedure? How do you guys align your passbands?

Dale -

Apparently the schematic that I included on my CD is incorrect.!
Indeed, pins 4 and 6 on the FF-1 schematic are reversed. I've never
owned one, and don't think I've even seen one "in the flesh"! :-)

Sorry for the confusion. I'll correct the schematic on the CD and have
attached a correct version.

Curt -

I've been traveling and missed most of this one.

The Carrier Oscillator signal should be about 4V p-p at the wiper of the Carrier Balance pot.

More than a few cases have been seen where the diode bridge or a winding inside T14 shorts to the can. The diodes are Germanium, so should show about 0.3V forward junction drop. Measuring at the unbalance DC input you should see two junctions in series.

The frequency shift for CW and AM is typically about 900 Hz.

Hi Garey,

Here you have my latest findings, following your advice:

>You don't mention any problem with the Sidetone. If C129 ESR has gone
>up, tone can couple across the diode keying circuit, keeping the VOX
>energized after the key is opened. Bridging with a good cap can verify.

I replaced C129 with an under-chassis 100uF/350V capacitor, removing the wire to C129, and it seems to have cured the problem. Great!!!

>Weak finals will present as you describe, but RF and INJ alignment
>should be checked before replacing. Also, check R26 for value and
>condition. This is the resistor that goes crispy when a metal alignment
>tool is used on the trimmers and accidentally shorts to the chassis,
>even momentarily. Puts the +250VDC supply directly across that poor
>little 1/2 W resistor!

R26 is fine and reads OK. Now I have been able to get about 40W on 20m... but it seems there is also a problem with the neutralization.

Anyway, as I have an spare 6JB6 set, I will try it to find if there is a huge improvement (I think so) or not.

BTW, I found also an intermittent problem in the RX/TX relay. I have carefully cleaned contacts and this has improved reception... I guess this set was unused for a long time.

Regards,

JOSE

Jose -

Cool! One down..... :-)

What brand of 6JB6s are you using. Some brands are difficult to
neutralize, and some will NOT. Best choices are Sylvania, Zenith, RCA
and GE. Other brands may or may not work, depending upon who
actually built them.

Thanks Garey:

I'll double check the can. Yes the diodes check just over .3V junction and nearly .7 in series.

I suspect that if the diodes or can were not working, it would be impossible to null out the carrier--what there is of it. This works ok.

I have double checked the grid cathoide Res, cathode resistors, and the cathode bypass cap by tacking in another. Nothing changes the output. m it is 1V P-P using a Tek scope w/ 100Mhz, 10:1 probe. I do have some REAL expensive FET probes but don't think I need them in this case.

I cleaned the trimmer cap per the other suggestion. I didn't take it apart but 90% IsoPropyl Alcohol works good to remove oxidation on silver.

Just for fun, I put in a 12aU7 and it did just what it should--output was much stronger. I couldn't get the freq right but it confirmed much of what is there is still working.

Knowing the grid-cathode voltages indicate the tube is not running hard enough, how do I go about testing the 5645 crystal? Ever see one go soft?

I have tried several different 12AX7's with no change.

Off to double check the can.

Thanks

Curt

Just checked out the T14 can, diodes and the crystal.

Diodes are each a little over .3V fwd.

No shorts or opens in the windings .

Used a Grid Dip meter to test the crystal. Same relative activity
when compared to other similar crystals in the meter.

Not sure where to look next.

Curt

Curt,
In the oscillator circuit, the grid resistor should build up negative bias with respect to the cathode due to the current from electrons captured by the grid. Since your grid and cathode voltage are about the same, and the cathode voltage is only 78% of what it should be, there must be something wrong in the grid circuit. The cathode current should be very high with the grid that far positive.

Possibly, you have a low impedance path to ground for the grid current of V1. This would have to be either through the grid resistor, C2, or the crystal. If you disconnect the top of C2 and the top of the crystal from the grid of V1, the proper DC bias condition should result - just without the oscillation. Then try reconnecting the crystal and C2 one at a time to find the culprit.

Perhaps a better idea to explain the symptoms would be that the tube socket pin for the grid is not making a good connection to the V1 grid pin. This would give the grid a high impedance to ground, and a low voltage with respect to the cathode (inside the tube). The cathode current would be lower than normal, but the low grid voltage would not show up in the external circuit, so this idea fits. Is pin 2 of the V1 tube or socket corroded? Is there any chance you need a new tube socket?

This is a good one! I've looked back over some of your earlier messages, and you have addressed just about everything I would have gone after. I have not seen any reference to C4, have you checked for RF on Pin 1? Should be none. I believe you have checked R2. Does T14 peak?

One off-the-wall problem I have seen before in tube sockets where "contact cleaner" has been liberally sprayed around. Leakage paths form between pins, often presenting as similar voltages on Grid and Cathode (Pin 2 & 3). Close examination will sometimes reveal these paths, (don't forget the top of the socket as well,) but sometimes the stuff actually penetrates the socket material below the surface.

Seems like it's often the simplest circuits that give us the most trouble! My next step would be to haywire the circuit through C5, terminated with a 470 ohm resistor, with all new parts, (point-to-point,) and evaluate the results. You can omit C1 since it is shorted in SSB anyway. Drake used the same circuit in 30,000 or more units, so ... :-)

From: captcurt2000
Topic: 1472 Message: 1495

Hi Garey:

There is something else going on in this one I think.

Never has had any type of solvent on the tube sockets. The tin-plate is still very shiny.

V1 has been in and out many times now and exchanged several times--never a hint of any instability or poor connection there.

I have bypassed pin one with extra cap--no improvement. Still dont have the chart numbers on the grid-cathode voltages. each of the resistors has been lifted one end and checked. Caps have been bridged.

Still getting 1V P-P.

One thing I did find was that the balance pot was 300 ohms instead of 200 on the print. Shouldnt make any difference as I get the same voltage out whether c5 is connected to the wiper or not--and same on both sides of c5 (AC)

I wasnt quite ready to build an off-board oscillator tho...since I could get 4.2-4.4 V P-P using a 12AU7 in place of the 12ax7. I puzzled at why I couldn't get the normal alignment responses as listed in the manual when I tried this the other night. So I did it again.

I finally got a very small increase in plate current in SSB with the carrier unbalanced to do the procedure in the manual. only problem is, when its done, I couldn't then rebalance the carrier.

HERE IS A PART I DONT GET: I basically disable the V3 mixer by pulling the tube. Also turn off the Q3 xtal oscillator and its premixer. Now I can see the RF chain Carrier output at the grid of the V3 mixer using a scope. I can see the alignment of t2 and t3, t14, and the centering result of adjusting c2 trimmer between the two passband filters this way without putting any load on the actual stages being adjusted.

So, I unbalance the carrier with the balance pot to get a signal. I adjust the trimmer to get equal amplitude signals through USB or LSB. I double check this result using a freq counter--it came in at 5644.65 when done visually comparing amplitudes.

Now, the book says to go to USB to peak t2 and t3 --Why is that?? It seems it should make no difference since I just set the carrier between the two filters. Anyway if I PEAK t2 and t3 in USB it reduces the amount coming through in LSB.--This seems weird because the frequency never changed. I can certainly peak them and readjust for

balance, etc, but the balance never comes at the possible peak of t2 for sure. T14 peaks quite broadly in any case.

Best result seems to be to fianlly compromise on the adjustment of t2 and t3 with c2 so everything remains equal between USB and LSB. Doing this leaves alot of signal on the table tho. IS this right?

I can go ahead after this and rebalance the modulator--still using the viewpoint of mixer grid. This setting remains nearly perfect once the other mixer and oscillator or back in operation. Just very little drive in SSB and CW at that point.

I'm expecting a set of new finals soon and these are the only parts not already replaced. It is possible that soft finals are causing the agc to restrict the drive.

Anyway, does any of this make sense? Why the direction to use USB for t2 and t3 tuning?

Thanks

Curt

From: bosonob2000
Topic: 1484 Message: 1496

I aligned the tuner according to the manual and indeed it was off a
little. Now it is very symmetric and the levels are way more even.
There still is a little roll off in the high frequency but not as much
as before. I definitely recommend looking at the passband with an
audio spectrum analyzer to confirm its aligned etc. Besides, it was fun!

Hi Again:

Realized the above was kind of convoluted so thought I would describe what I am observing a little better. Pretty much does the same thing whether I have 1V or 4 V oat the balance pot wiper.

When setting c2 trimmer and adjusting t3--

I can adjust c2, t2, and t3 all for maximum equal signal on USB/LSB but this signal is well below the maximum peak available from t3. If I switch over to LSB, the signal drops to nominal zero--I can readjust t3 to get a very large signal.

Of course that is no longer equal between USB/LSB.

By bringing t3 off the center frequency, in line with either USB or USB I can get alot more output. I assume I need to retain the equal levels between upper and lower at the t3 adjustment?

I think I understand what you are saying.

Keep in mind that the two filters are arranged in the letter "M". The correct setting for the Carrier Oscillator is in the "trough" in the center of the "M". This trough is not infinite, so when you are adjusting for equal level in the two filters, what you are doing is centering the oscillator in the "bottom" of the "M". This trough is part of the carrier suppression, and so should be adjusted for minimum signal is both filters.

Remember, the object is to have _MINIMUM_ carrier out for normal operation. When you switch to CW/AM, C1 is unshorted, shifting the carrier by about 900 Hz and putting it INSIDE the filter passband where it is passed through to become a CW or AM carrier signal.

You will only have 4 V p-p in CW/AM.

Hi Garey:

Yes I guess I got it all..the "M" is a good description of the filter result.

The 4V P-P you refer to only in CW and AM, at the wiper of the balance pot, the frequency shift shouldn't make any difference in the output level should it?

It changes output level after the balanced mod if the dc unbalance voltage is there and the signal is shifted into the passband of the LSB filter?

I have it aligned and it seems to be working after a fashion. I have almost 50V P-P of drive at the grids of the finals in full TUNE.

I can watch the peaks there on a scope when in SSB and they are getting right up there also--although they seem to show almost no noticable PA current peaks--nowhere near the .15 level. just barely moving above the bias level.

I have one of the Heathshop PS kits coming in for this rig and a new pair of finals so will wait to see what the result of all this is.

Curt.

Thanks

Curt

Curt -

Right. The 4V p-p should be at the wiper of the pot regardless of the frequency shift. There should be very little, if any signal visible after the filters IF the Carrier Oscillator is centered and the Balanced Modulator is nulled properly when in SSB. The unbalance current from the GAIN pot should increase the carrier OUTPUT from the BM, and the shift should move it to within the passband of the LSB filter.

The scope will load the grids of the finals, so difficult to actually quantify it. Do the finals neutralize? You should get full output in TUNE mode with the GAIN control set to about 10 - 11 o'clock. The final plate voltage should be about 700 VDC no load, and 650 VDC at full load (350 mA), and the screen should be about 260 VDC. Have you verified the value of the cathode resistors in the final? They should be 15 ohms, +/- 5%, and certainly within 5% of each other. Same situation with the screen resistors, should be 68 ohms +/- 5%. One other potential problem is the meter shunt resistor. These also change value with time and/or overload, although they typically go high, causing the plate meter to read higher than actual plate current.

1501. R4C AGC "Extra Knob"

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-13 21:41:00 UTC
From: Roger
Topic: 1501 Message: 1501

I just acquired a R4C (s/n 23476) that has what looks like an extra knob on the AGC main shaft. The normal AGC knob (OFF/F/M/S plus 2 more positions moving CW) is there plus a center knob on the AGC shaft that has 5 positions also. What do I have?

This is my first R4C since the mid 70's, so I am anxious to learn what this one has (if anything) over my older R4C, since long gone.

Since the post, I decided to take off the covers and I can see it has the Noise Blanker pwb and at least one Sherwood mod on the left hand top side, looks like a pwb assy with a couple of long, silver looking enclosures and some input/output little devices (maybe switches to switch in and out the filters?). It says, "Sherwood SSB" on the pwb.

Very interesting. I am trying to follow the wires from the extra gang on the switch but it is so crowded. It does sound like it has pretty good selectivity. This is the first time I have been exposed to the Sherwood mods in a R4C. I had one many years ago with no mods and I thought it was a great receiver then.

Thanks!

From: Garey Barrell
Topic: 993 Message: 1504

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Bob -

They are 1/8" dia (0.125"). There are ten (10) plus one (1) more at the rear end of the shaft.

Ace or True Value Hardware stores usually have them in the little (yellow?) plastic drawers of odd hardware.

Hello Garey,

As you know, I fixed a TR-4C PTO some weeks ago :-)... but one comment has made me think:

>They are 1/8" dia (0.125"). There are ten (10) plus one (1) more at the
>rear end of the shaft.

Where is located the 11th ball???. I don't recall there was a place for it... perhaps I completely missed it.

A picture would be worth a lot!

Jose -

Well, it's been quite a few years since I had to re-do a PTO. I may be confusing it with the Collins PTO, which has a glass ball at the rear bearing.

I'm picturing a "dish" in the rear end of the lead screw, a "cup" style set-screw, and a bearing ball between. I vaguely recall having to use grease to hold the ball in place for assembly. If you didn't completely remove the lead screw, then the grease may have just held it in place? Possible?

I have a bit of a thump on going back to RX. No difference tween fast
and slow AGC. My Omni C from yrs ago had a similar problem and there
was a simple mod for that ... don't remember now what it was and no
idea whether it would apply to the TR-7. It did mess up the S-meter
reading though.

Date: 2008-11-20 16:24:32 UTC
From: jch39_99
Topic: 1519 Message: 1519

I was reading on the "Drake Mailing List" about the effectiveness of the fan on the TR-7.

I am wondering if it might solve a couple of my "issues".

1. My TR-7 continues to drift even after a 30 min warm up period (sometimes worse than others).
2. I run my TR-7 at 50 watts output. The power fluctuates i.e. to say I have to occasionally adjust it if I want to stay at 50 watts.

I assume the fan would help problem #1. How about problem #2?

Subject: [DrakeRadio] Front panel for MS-4?

Good Morning:

Does anyone have a front panel they want to part with for a MS-4 speaker?

Can be rusty or banged up OK.

Or perhaps a source for matching perferorated material?

Thanks

Curt
KU8L

Hi Kurt,
I have a spare 12 X 12 sheet in aluminum- exact same holes and stagger as
the MS-4 front. Also a virtually like new logo.
E-Mail me directly, if interested.

I may be able to help but need to check "inventory" first. If you don't hear from me in a week email me if you still need the front panel. I think I have a slightly dented MS-4 cabinet w/o a speaker inside.

N4JZY

Hi Randy,
I have had one on my TR-4CW/RIT for a couple of months now. I believe it to be the best unit out there. Mine came programmed for the TR-4. I have done the band by band offsets to accommodate any shifts in the band crystals. The fact that it reads to 10Hz makes it possible to stay on freq in an SSB QSO w/o incurring complaints from the modern rig users. The other units that only go to 100Hz just cannot do this.
I had to modify the connector to the RV-4 socket in the rig so that the cable exits the side of the
Jones plug as opposed to the "top" as I don't use riser feet on my Drake.
Finally, the custom Drake blue color is the icing on the cake.

Thanks Dale

The person who sells the DD-103 has never hooked one up to a C-Line. He thought I should make connections to cathode of the pre-mixer V6. I was wandering if anyone else had connected the DD-103 with this method.

Randy,

I have the DD-103 hooked to my R4B but I had it installed by Jeff Covelli (WA8SAJ) a couple of years ago when he did an alignment on my B-Line.

I could take a look tonight to see how he did it or you can just contact Jeff direct.

Randy,

No problem. Jeff is a good guy and does great work. He's worked on all my Drake gear and his rates are very reasonable. It's probably a good idea to have the C-Line checked out. I bought a mint TR7A from a guy who used it for about 5 hours then put it in storage for 20+years. Just to make sure, I sent it to Jeff for a thorough check up and he had do a complete alignment which also brought the receive up an additional 15db.

Randy -

The DD-103 appears to count only the PTO signal, with the Band
Oscillator and Carrier Oscillator frequencies "programmed" in for offset.

The cathode of V6, (Pin 1 or 3,) of the PreMixer stage would be the
easiest place to pick up the PTO signal.

Hi Crit

Unless I've missed it I haven't seen a reply to your query yet but I'm certainly interested.

I also run a TR7 but have never had a problem with drift etc after the initiall warm up. Although mine is fitted with a fan (115 vac) I can't use it as I don't have a PS7 and run on a standard DC 30amp PSU - so no 115vac supply to fan.

I could fit a 12v fan but as the rig stays cool and no appreciable drift I haven't bothered. I generally run the rig at 100w.

Bottom line is that I'm not sure that a fan is the answer to your problems but I will wait and see if there is any input to your query and learn from that.

Take care

Subj: [DrakeRadio] TR-7 and Fan

I was reading on the "Drake Mailing List" about the effectiveness of
the fan on the TR-7.

I am wondering if it might solve a couple of my "issues".

1. My TR-7 continues to drift even after a 30 min warm up period
(sometimes worse than others).
2. I run my TR-7 at 50 watts output. The power fluctuates i.e. to say
I have to occasionally adjust it if I want to stay at 50 watts.

I assume the fan would help problem #1. How about problem #2?

Crit -

HOW does it continue to drift? Always in the same direction?
Wandering up and down? Smooth or "jumpy"?

WHY do you run it at 50W? Saving electricity? Saving the PA?
Personal preference?

As Jim reported, the fan, when properly installed, does a good job of keeping the internal temperature constant over time. The PTO area is slightly elevated, but stable. Temperature _changes_ are the enemy of stability.

Good Afternoon Garey;

I run 50 watts ... left over habit of having a rig (Ten Tec Argosy II) which I liked but there were no final transistor replacements any longer. So, guess you would say saving the PA. Although in my early days I ran low power to avoid nasty phone calls from my neighbors. Never found a reason to push the limits.

The frequency shift seems to be some what up and down, never in large amounts.

I have the TR-7 sitting atop of the PS-7. Can feel a fair amount of heat from the vents on top of the rig.

1533. TR7 Power Output

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-21 17:44:18 UTC
From: James Chaggaris
Topic: 1533 Message: 1533

Here's a new one that maybe someone can help me with. Since my TR7A puts out 120-130W on 40, I always turn down the drive level to about 70W when running my L7 amp. Recently, I noticed that when I turn the ouput down to 70W and leave the rig keyed for a few seconds, the output starts to creep up from 70W to 73W then 78W etc...on up to 80+ watts. I haven't kept it keyed down for a long time to see if it creeps up any more than 80W but it's got me puzzled.

Also, when I'm running the full ouput(130W), the ouput remains stable..

Any thoughts?

73,

Jim N9WW

Crit -

OK. Well the PA of the TR-7 is very conservatively rated, and will run full power (120 -130W output) "forever". Some just have to turn the output ALC up to 140 - 150W or even up to almost 200W. It WILL run that much power, but there is no room for error such as antenna problems, overheating, etc. So reducing power below 120W or so really doesn't protect anything but the electric bill! :-) I don't know if the transmit ALC control will set that low or not, but that would be the way to do it if you just don't want to run more than 50W.

Putting the TR-7 on top of the PS-7 is not a particularly good idea. Again, temperature variations are the enemy of stability. When you transmit, the PA heats up, and the power supply heats up. When you go back to receive, they both cool down. Having the TR-7 on top lets that heat variation from the power supply rise up to the TR-7.

I would try sitting the PS-7 on the floor, or even on top of the TR-7 to see if that helps.

Aside from that, I have found cases where the analog switch IC U1, on the Parent board, gets noisy. This "noise" is applied to the PTO's RIT pin and can cause random small frequency changes. The effect can appear even with the RIT Off. A sensitive scope on the RIT pin (on the side of the PTO) can show this voltage.

Jim -

Probably increases in gain as the PA and driver transistors heat up. At full output, the power level is controlled by the transmit ALC (green LED on the front panel). Connect the ALC and the problem will take care of itself.

From: jch39_99
Topic: 1519 Message: 1536

Thanks Garey for the input.

Boy, will have a hard time finding space on the floor to put the PS.
You would not believe what is there already ... not your problem.

Incidentally, the power creeping up problem noted in another message
is the same on my rig ... your response makes sense.

I think the prior owner had set the ALC limit to 100 w already. Can't
get higher than 100w out on any band (into a dummy load) no matter
where I set the ALC control.

Good to hear that the TR-7 is so over built it can loaf along at 100 -
120 watts.

Getting a fan and will see about finding space for the PS on floor.

Tnx agn.

1537. TR-4CW/RIT

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-21 22:34:53 UTC
From: DALE PARFITT
Topic: 1075 Message: 1537

I have noticed that when I tune an SSB station to what sounds normal to me (I know the what TX stations voices sound like in person), everyone reports me to be 30-50Hz off on TX. Indeed now that I have the digital readout, I see the 40Hz shift when I press PTT. I have measured the OA2 at a stiff 145VDC and the DC going into the PTO as 11.1VDC- no change on TX. I think that the PTO's zener is a 10V zener. 1.1 VDC seems like a small differential for the zener to operate under (11.1-10). Is 11.1 normal for the DC into the PTO and/or any ideas what causes the shift? I seem to recall my other TR-4CW/RIT does not shift.
Is this normal? Is it just different loading of the PTO under TX?

Tnx,

Dale W4OP

Hi Crit,

You can use Garey other suggestion, and put the PS-7 on the top of the TR-7
help a lot with the heat subtraction from the TR-7 since hot air rises the
PS-7 heat will not affect the TR-7 , but the reverse will be true, the the
TR-7 heat will affect the PS-7, but the PS isn't the D.U.T. so no big deal.

v44kai.....Joel.

Dale -

I assume you have the RIT turned off?

The current source for the Zener in the PTO is actually via R140 from the 150 Reg bus. the Zener is 10V, but there is a 100 ohm decoupling resistor inside the PTO that causes the 11V reading.

What digital readout are you using? If it's the DD-103 discussed here (or somewhere?) recently, it actually measures only the PTO. If that is the case, I would look at the RIT circuitry. The 4016 analog switches are not often noisy and/or leaky. Check the voltage on the RIT terminal on the PTO to see if it's varying from R to T.

If NOT the DD-103, it's possible that one of the other oscillators, Carrier or Band, are changing from R to T. Both are crystal controlled, so not likely, but stranger things have happened.!

The PTO loading does not change from R to T.

Hi Garey,
Yes, the RIT is off.
I did not see the CW/RIT PTO schematic on your CD- did I miss it or is it on your site?
OK on the 11.1VDC- I was aware of the 100 Ohm resistor- I just thought they would have run more current through the zener- but I see it is 10mA which is fine.

I can hear the PTO shift on my R7 when listening directly in the 5 MHz region- so it is the PTO.
So, until I get the PTO schematic (which I think is the same as the TR-7 PTO?) and know where to find the RIT input I'll continue probing and have a look at the RIT board and monitor the output there.
Thanks,

Dale W4OP

Hi Garey,
I see w/ the RIT off, the output voltage does change by 20-40mV when I go from RX to TX- and when I vary the RIT that amount (w/ RIT on) it does account for the RX/TX shift.
Would changing out the 4016 eliminate this or greatly reduce it?

Dale W4OP

Dale -

The TR-4CwRIT Driver file should be on your CD in the "Versions" folder.

The PTO schematic IS the TR-7 schematic. The RIT terminal is what used
to be the RTTY terminal, on the side just behind the gearbox.

OK. Now that you have the schematics, verify that the +15 at D301 is
stable, and if it is I would replace the 4016. I would also suggest
putting a low profile socket under it!

Dale -

OK. Now that you have the schematics, verify that the +15 at D301 is stable, and if it is I would replace the 4016. I would also suggest putting a low profile socket under it!

Hello.

I have for your consideration the following:

TR4CW/RIT with NB
AC4R
MS-4
DC-4
MN-4
300w dummy load
Above setup working beautifully with $1200 invested.

TR4 with NB
AC3
not working;lites up hear static with $100 invested.

TR4 without NB (no hole for NB)
AC4
RV4
not working; lites up also but just static with $200 invested

B Line
R4B
TX4B
AC4
MS-4
From a smoker; arrived with AC4 in MS-4 with case bent and fuse
holder broken;
R4B top case cover also slightly bent near the rear with $500 invested.

My interest have changed and would like some else to have them.

Selling as one lot, might consider splitting later.

I figured to have invested over $2000.

Would consider offer for the next two days (Sat, Sun) Nov 29 and Nov 30.

Please email direct.

thank you for the bandwidth.

I finally got a chance to dig into the radio this week. Sure enough, R1187 did not exist; not even a place on the PWB for it to go. I lifted one leg of CR1119 and inserted a 10k resistor in series.

All is good, and my ears are happy.

From: Randy
Topic: 1554 Message: 1554

I presently have a Drake 2B Receiver and I'm thinking about mating a Drake T-4X, or T-4XB, or T-4XC. Of those three choices, which one would you pick to match to a 2B receiver. I'm thinking of using this setup mostly for AM operation. Any and all comments will be gratefully received.

Thanks and 73,

Randy - K8HRO

1555. Re: [DrakeRadio] Which T-4X would be best?

Yahoo group: DrakeRadio (2006 — 2011)

From: Garey Barrell
Topic: 1554 Message: 1555

Randy -

Not much difference among the three. The T-4X only has four-pole sideband filters, so the carrier and unwanted sideband suppression are inferior. Strictly speaking, it will probably not meet current "Purity of Emission" standards. Of NO concern on CW or AM, but might make you unpopular with nearby hams, especially if you decide to add a linear amp!! Most likely no one would notice unless they happened to live next door and operate the same bands and modes you do!! The B and C models have eight pole filters so no problem. The B and C have FET PTOs, which are slightly more stable than the Bipolar PTO, but not significantly.

Aside from that, the other differences are cosmetic. The T-4X and B have five kHz marks on dial with 1 kHz marks on knob skirt, (kinda like the 2-B!,) the C has dual disc dial mechanism.

Any of them will benefit from a small fan on the back of the Final cage, blowing OUT, to reduce heat and extend final tube life.

To the rest of the Luddites out there -

I know you're out there, I can hear you breathing........

Jim and Don have done really nice work with LEDs, and it's a very nice blue, but it's not "Real Blue" !! :-)

I finally got some time to work out something that has been bothering me for a while. The Drake "Blue" tends to go green with age, resulting in a not-so-pretty blue-green dial. There have been various theories / excuses for this, usually revolving around the fact that incandescent bulbs such as the #47 and #755 have a "yellowish" cast to them. Well, they really don't, unless you have extremely low line voltage.

The reason appears to be that the "white" paint on the reflectors of the dial and meter housing tends to yellow with age, and this is where the "tint" is coming from. When the blue film fades a little bit, (difficult to see unless you put it on a sheet of white paper,) the yellow overpowers it and _blue-green_ dials...

So. One can of Testor's Flat White spray enamel from the Hobby shop, a quick spray, a new piece of Lee Lighting #172 "Lagoon Blue", and the dial and meter have that beautiful, "Real Blue" glow.

1561. T4XB problem in LSB, OK in USB

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-11-30 06:43:30 UTC
From: Ryan Pigg
Topic: 1557 Message: 1561

Greetings group,

I'm working on another T4XB that I paid too much for only to find out there is a problem with it.

I put it on the air on 80m and received reports that I was off freq while checking into a net. I listed to it on my receiver and indeed, the audio drifts and sounds garbled in LSB. Oddly, it sounds fine in USB.

I already changed the Blue (date code 7015-8) LSB filter from a parts unit. Still have the same problem in LSB, but OK in USB. Could my parts unit filter be bad too? Are these filters a common failure? Could the filter match xfmrs be out of tune? (I have not tweaked anything yet) Or could it be one of the diodes in the bal mod that may be leaky? That's not too fun to get into so I thought I'd ask the guys here before tearing into it.

Thanks group,

73, Ryan, N7QJ

Hello Ryan,

A diode in the balance modulator being bad would affect both USB and LSB, not just one sideband.

Somehow I doubt both filters are bad. I could be wrong but I've never seen this happen before, two filters be bad at the same time. Maybe Garey has but I haven't.

My first thought is to check the carrier generator oscillator, V1. If you have access to a frequency counter, connect the counter to the carrier null pot wiper, R4 to read the carrier generator's crystal frequency. It should be close to 5.645Mhz. If you don't have a frequency counter or access to one, use a separate accurate receiver tuned to 5.645Mhz with a wire connected to the receiver's antenna then wrap the other end around V1. Zero beat the signal and note the receiver's dial. A receiver with a digital dial works much better when doing this check. You don't have to place the T4XB in transmit to hear V1's carrier oscillator signal. I have seen this oscillator be off frequency and even stop working. A non-working V1 carrier oscillator will produce zero output in all modes on all bands.

You can also use a piece of wire with a .01ufd cap in series, touching the carrier null pot's wiper with the other end of the wire connected to the separate receiver's antenna. The cap serves as a DC blocking capacitor keeping any DC voltage off the receiver's antenna, just a safety thing with me. No need for any DC voltage being applied to the separate receiver's antenna connection.

The other question is, are you operating the T4XB with a R4XB or other Drake receiver using the TRANSCEIVE switch settings at either "RCVR or "XMTR" positions? If so did you check the alignment and, if required, adjust them appropriately as indicated in the manual for this function?

Mike,

Dohhhh! you called it - the carrier osc was off frequency. It was reading about 5.6445.. I adjusted C2 to right on 5.645 and now it sounds good on LSB.

I did not think about that since everything else was working (full power out in tune, USB etc). but it would make since that it being off would skew the signal so not all would go through the filter..

Now I'm going to put the orig filter back in and my parts unit (now no longer a parts unit) is next on the bench.

Thanks again for your time and for enlightening me!

Well "Shazam Sgt Carter" that's great. Have fun, I'm sure you're going
to enjoy the T4XB transmitter, it's a nice transmitter.

Mike,

Well, the LSB issue is fixed and the orig filter is back in - all good 80-15m LSB/USB, however, on 10m, when I key the mic, it acts as if it is tune mode.

Any ideas?

Thanks, Ryan

BTW - I have 4 T4XB's - 2 complete functioning, 1 parts unit (basket case) and the one I am working on. They sure are nice rigs.

OK, we are all good now. GE tubes and C49 was not even meshed. What was odd was that when I keyed it, it was 500kHz off from the VFO freq. So there was an oscillation which would go away if you bumped the load control. Now the Xmtr has been neutralized and works as it should!

Now I can button this up. Thanks again Mike for your help. This was a good learning experience.

1567. TR-7 5.645 MHz xtal

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-01 00:26:10 UTC
From: Al Scanandoah
Topic: 1567 Message: 1567

Does anyone happen to have one of these? It's the one for the CW oscillator on the IF/audio board.

Discovered that my CW note was rather mushy, due to slow oscillator startup. Unfortunately, during the troubleshooting process, the crystal died out altogether.

Tnx & 73 - Al, K2ZN

1568. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-01 08:14:16 UTC

Topic: 1567 Message: 1569

Good morning Al,

I don't have a 5.645Mhz crystal. If you can't locate a good used one
then International Crystals in Oklahoma City, OK, can make one for you.
